PARTIAL DERIVATIVES
Section: [13.1]
FUNCTIONS OF TWO OR MORE VARIABLES

## NOTATION AND TERMINOLOGY

The notation for a function of two or more variables is similar to that for a function of a single variable.

$$
z=f(x, y)
$$

2 Variables

$$
w=f(x, y, z)
$$

3 Variables

Function of two variables

Function of three variables

## NOTATION AND TERMINOLOGY

## Definition of a Function of Two Variables

$\checkmark$ Let $D$ be a set of ordered pairs of real numbers.
$\checkmark$ If to each ordered pair $(x, y)$ in $D$ there corresponds a unique real number $f(x, y)$ then $f$ is a function of $x$ and $y$.
$\checkmark$ The set $D$ is the domain of $f$ and the corresponding set of values for $f(x, y)$ is the range of $f$.
$\checkmark \quad x$ and $y$ are called the independent variables and $z$ is called the dependent variable.

## NOTATION AND TERMINOLOGY

Example Find the domain of the function $f(x, y)=\frac{\sqrt{x^{2}+y^{2}-9}}{x}$

The function $f$ is defined for all points $(x, y)$ such that $x \neq 0$ and

$$
x^{2}+y^{2}-9 \geq 0 \Rightarrow x^{2}+y^{2} \geq 9
$$

So, the domain is the set of all points lying on or outside the circle $x^{2}+y^{2}=9$ except those points on the $y$-axis.

## NOTATION AND TERMINOLOGY

Example Find the domain of the function $f(x, y)=\sqrt{y+1}+\ln \left(x^{2}-y\right)$

- Note that $\sqrt{y+1}$ is defined only when $y \geq-1$.
- Also, $\ln \left(x^{2}-y\right)$ is defined only when $x^{2}-y>0$ and hence $y<x^{2}$.
- Thus, the natural domain of $f$ consists of all points in the $x y$-plane for
 which $-1 \leq y<x^{2}$.

## NOTATION AND TERMINOLOGY

Example Find the domain of the function $f(x, y, z)=\sqrt{1-x^{2}-y^{2}-z^{2}}$

$$
1-x^{2}-y^{2}-z^{2} \geq 0 \Rightarrow x^{2}+y^{2}+z^{2} \leq 1
$$

The natural domain of $f$ consists of all points on or within the sphere whose center is $(0,0,0)$ and radius 1 .

## LEVEL CURVES

The set of all points $(x, y, f(x, y))$ in space, for $(x, y)$ in the domain of $f$, is called the graph of $f$.

The graph of $f$ is also called the surface $z=f(x, y)$.

## LEVEL CURVES

The set of points in the plane where a function $f(x, y)$ has a constant value $f(x, y)=c$ is called a level curve of $f$.

## LEVEL CURVES

The curve in space in which the plane $z=c$ cuts a surface $z=f(x, y)$ is made up of the points that represent the function value $f(x, y)=c$. It is called the contour curve $f(x, y)=c$.

The contour curve $f(x, y)=100-x^{2}-y^{2}=75$ is the circle $x^{2}+y^{2}=25$ in the plane $z=75$.

The level curve $f(x, y)=100-x^{2}-y^{2}=75$ is the circle $x^{2}+y^{2}=25$ in the $x y$-plane.

## LEVEL CURVES

Example Sketch the contour plot of $f(x, y)=4 x^{2}+y^{2}$ using level curves of height $k=0,1,2,3,4,5$.

$$
\begin{aligned}
& f(x, y)=k \quad 4 x^{2}+y^{2}=k \\
& k=0 \quad 4 x^{2}+y^{2}=0 \quad(0,0) \\
& k>0 \quad \frac{x^{2}}{k / 4}+\frac{y^{2}}{k}=1
\end{aligned}
$$

Which represents a family of ellipses with $x$-intercepts $\pm \frac{\sqrt{k}}{2}$
and $y$-intercepts $\pm \sqrt{k}$.

## LEVEL CURVES

Example Sketch the contour plot of $f(x, y)=4 x^{2}+y^{2}$ using level curves of height $k=0,1,2,3,4,5$.

$$
\begin{aligned}
& f(x, y)=k \quad 4 x^{2}+y^{2}=k \\
& k=0 \quad 4 x^{2}+y^{2}=0 \quad(0,0) \\
& k>0 \quad \frac{x^{2}}{k / 4}+\frac{y^{2}}{k}=1
\end{aligned}
$$

Which represents a family of ellipses with $x$-intercepts $\pm \frac{\sqrt{k}}{2}$ and $y$-intercepts $\pm \sqrt{k}$.

## Course: Calculus (3)

Chapter: [13]<br>PARTIAL DERIVATIVES

Section: [13.2]
LIMITS AND CONTINUITY

## LIMITS ALONG CURVES

- For a function of one variable there are two one-sided limits at a point $x_{0}$, namely,

$$
\lim _{x \rightarrow x_{0}^{+}} f(x) \text { and } \lim _{x \rightarrow x_{0}^{-}} f(x)
$$

reflecting the fact that there are only two directions from which $x$ can approach $x_{0}$, the right or the left.

- For functions of several variables the situation is more complicated because there are infinitely many different curves along which one point can approach another.

## LIMITS ALONG CURVES

If $C$ is a smooth parametric curve in 2 -space that is represented by the equations $x=x(t)$ and $y=y(t)$, and if $x_{0}=x\left(t_{0}\right)$ and $y_{0}=y\left(t_{0}\right)$, then

$$
\lim _{\substack{(x, y) \rightarrow\left(x_{0}, y_{0}\right) \\(\text { along } c)}} f(x, y)=\lim _{t \rightarrow t_{0}} f(x(t), y(t))
$$

## RELATIONSHIPS BETWEEN GENERAL LIMITS AND LIMITS ALONG SMOOTH CURVES

- If $f(x, y) \rightarrow L$ as $(x, y) \rightarrow\left(x_{0}, y_{0}\right)$, then $f(x, y) \rightarrow L$ as $(x, y) \rightarrow\left(x_{0}, y_{0}\right)$ along any smooth curve.
- If the limit of $f(x, y)$ fails to exist as $(x, y) \rightarrow\left(x_{0}, y_{0}\right)$ along some smooth curve, or if $f(x, y)$ has different limits as $(x, y) \rightarrow\left(x_{0}, y_{0}\right)$ along two different smooth curves, then the limit of $f(x, y)$ does not exist as $(x, y) \rightarrow\left(x_{0}, y_{0}\right)$.

## LIMITS ALONG CURVES

Example Evaluate $\lim _{(x, y) \rightarrow(0,0)}-\frac{x y}{x^{2}+y^{2}}$ along:
(1) the $x$-axis $(y=0)$

$$
\lim _{(x, 0) \rightarrow(0,0)}-\frac{x \times 0}{x^{2}+0^{2}}=\lim _{x \rightarrow 0} \frac{0}{x^{2}}=0
$$

(2) the $y$-axis $(x=0)$

$$
\lim _{(0, y) \rightarrow(0,0)}-\frac{0 \times y}{0^{2}+y^{2}}=\lim _{y \rightarrow 0} \frac{0}{y^{2}}=0
$$

## LIMITS ALONG CURVES

Example Evaluate $\lim _{(x, y) \rightarrow(0,0)}-\frac{x y}{x^{2}+y^{2}}$ along:
(3) the line $y=x$

$$
\lim _{(x, x) \rightarrow(0,0)}-\frac{x \times x}{x^{2}+x^{2}}=\lim _{x \rightarrow 0} \frac{-x^{2}}{2 x^{2}}=\frac{-1}{2}
$$

(4) The parabola $y=x^{2}$

$$
\lim _{\left(x, x^{2}\right) \rightarrow(0,0)}-\frac{x \times x^{2}}{x^{2}+x^{4}}=\lim _{x \rightarrow 0} \frac{-x^{3}}{x^{2}\left(1+x^{2}\right)}=0
$$

Since we found two different smooth curves along which this limit had different values then the limits does not exist

## LIMITS ALONG CURVES

Example Show that the following limit does not exist.

$$
\lim _{(x, y) \rightarrow(0,0)} \frac{x^{2}-3 y^{2}}{x^{2}+2 y^{2}}=\frac{0}{0}
$$

(1) the $x$-axis

$$
\lim _{(x, 0) \rightarrow(0,0)} \frac{x^{2}-0}{x^{2}+0}=1
$$

(2) the $y$-axis

$$
\lim _{(0, y) \rightarrow(0,0)} \frac{0-3 y^{2}}{0+2 y^{2}}=-\frac{3}{2}
$$

The limit does not exist

## LIMITS ALONG CURVES

Example Show that the following limit does not exist.

$$
\lim _{(x, y) \rightarrow(0,0)} \frac{x^{3} y}{x^{6}+y^{2}} \quad=\frac{0}{0}
$$

(1) the $x$-axis

$$
\lim _{(x, 0) \rightarrow(0,0)} \frac{0}{x^{6}+0}=0
$$

(2) The curve $y=x^{3}$

$$
\lim _{\left(x, x^{3}\right) \rightarrow(0,0)} \frac{\left(x^{3}\right)\left(x^{3}\right)}{x^{6}+x^{6}}=\lim _{x \rightarrow 0} \frac{x^{6}}{2 x^{6}}=\frac{1}{2}
$$

The limit does not exist

## LIMITS ALONG CURVES

Example Evaluate $\lim _{(x, y) \rightarrow(-1,2)} \frac{x y}{x^{2}+y^{2}}=\frac{(-1)(2)}{(-1)^{2}+2^{2}}=-\frac{2}{5}$

Example Evaluate $\lim _{(x, y) \rightarrow(1,4)}\left(5 x^{3} y^{2}+9\right)=5\left(1^{3}\right)\left(4^{2}\right)+9=89$
Example Evaluate $\lim _{(x, y) \rightarrow(0,0)} \frac{1}{x^{2}+y^{2}}=\frac{1}{0+0}=+\infty$ does not exist

## LIMITS ALONG CURVES

Example Evaluate $\lim _{(x, y) \rightarrow(0,0)} \frac{x^{4}-y^{4}}{x^{2}+y^{2}}=\frac{0}{0}$

$$
\begin{aligned}
\lim _{(x, y) \rightarrow(0,0)} \frac{x^{4}-y^{4}}{x^{2}+y^{2}} & =\lim _{(x, y) \rightarrow(0,0)} \frac{\left(x^{2}-y^{2}\right)\left(x^{2}+y^{2}\right)}{x^{2}+y^{2}} \\
& =\lim _{(x, y) \rightarrow(0,0)}\left(x^{2}-y^{2}\right) \\
& =0
\end{aligned}
$$

## LIMITS ALONG CURVES

Example Evaluate $\lim _{(x, y) \rightarrow(0,0)}\left(x^{2}+y^{2}\right) \ln \left(x^{2}+y^{2}\right)=0 \cdot \infty$

- It is not evident whether this limit exists because it is an indeterminate form of type $0 \cdot \infty$.
- Although L'Hospital's rule cannot be applied directly, we can find

$$
\begin{array}{ll}
x=r \cos \theta & y=r \sin \theta \\
r^{2}=x^{2}+y^{2} & \tan \theta=y / x
\end{array}
$$

## Note

Since $r \geq 0$ then $r=\sqrt{x^{2}+y^{2}}$, so that $r \rightarrow 0^{+}$if and only if $(x, y) \rightarrow(0,0)$
this limit by converting to polar coordinates.

## LIMITS ALONG CURVES

Example Evaluate $\lim _{(x, y) \rightarrow(0,0)}\left(x^{2}+y^{2}\right) \ln \left(x^{2}+y^{2}\right)=0 \cdot \infty$

$$
x=r \cos \theta \quad y=r \sin \theta
$$

$$
=\lim _{r \rightarrow 0^{+}} r^{2} \ln \left(r^{2}\right)
$$

$$
=\lim _{r \rightarrow 0^{+}} \frac{2 \ln r}{1 / r^{2}}
$$

$$
=\lim _{r \rightarrow 0^{+}} \frac{2 / r}{-1 / r^{3}}
$$

## Note

Since $r \geq 0$ then $r=\sqrt{x^{2}+y^{2}}$, so that $r \rightarrow 0^{+}$if and only if $(x, y) \rightarrow(0,0)$

$$
=\lim _{r \rightarrow 0^{+}}\left(-r^{2}\right)=0
$$

## LIMITS ALONG CURVES

## Example Evaluate the following limit by converting to polar coordinates.

$$
\lim _{(x, y) \rightarrow(0,0)} \frac{x^{2} y^{2}}{\sqrt{x^{2}+y^{2}}}=\frac{0}{0} \quad \begin{aligned}
x & =r \cos \theta \\
y & =r \sin \theta \\
r^{2} & =x^{2}+y^{2}
\end{aligned}
$$

Remember that $r \rightarrow 0^{+}$if and only if $(x, y) \rightarrow(0,0)$.
$\begin{aligned} \lim _{(x, y) \rightarrow(0,0)} \frac{x^{2} y^{2}}{\sqrt{x^{2}+y^{2}}} & =\lim _{r \rightarrow 0^{+}} \frac{(r \cos \theta)^{2}(r \sin \theta)^{2}}{r} \\ & =\lim _{r \rightarrow 0^{+}} r^{3} \cos ^{2} \theta \sin ^{2} \theta=0\end{aligned}$

## LIMITS ALONG CURVES

Example Evaluate the following limit.

$$
\begin{aligned}
\lim _{(x, y, z) \rightarrow(0,0,0)} \tan ^{-1}\left[\frac{1}{x^{2}+y^{2}+z^{2}}\right] & =\tan ^{-1}\left(\frac{1}{0}\right) \\
& =\tan ^{-1} \infty \\
& =\frac{\pi}{2}
\end{aligned}
$$

## CONTINUITY

A function $f(x, y)$ is said to be continuous at $\left(x_{0}, y_{0}\right)$ if $f\left(x_{0}, y_{0}\right)$ is defined and if

$$
\lim _{(x, y) \rightarrow\left(x_{0}, y_{0}\right)} f(x, y)=f\left(x_{0}, y_{0}\right)
$$

In addition, if $f$ is continuous at every point in an open set $D$, then we say that $f$ is continuous on $D$, and if $f$ is continuous at every point in the $x y$-plane, then we say that $f$ is continuous everywhere.

## CONTINUITY

NOTE We will regard $f$ as being continuous if the surface has no tears or holes.

Hole at the origin

Infinite at the origin

Vertical jump at the origin

## CONTINUITY

Example $\begin{aligned} f(x, y)=\frac{x^{3} y^{2}}{1-x y} \text { is continuous except where } 1-x y & =0 \\ y & =\frac{1}{x}\end{aligned}$

Example Let $f(x, y)=\left\{\begin{array}{cll}\frac{\sin \left(x^{2}+y^{2}\right)}{x^{2}+y^{2}} & : & (x, y) \neq(0,0) \\ 1 & : & (x, y)=(0,0)\end{array}\right.$ Show that $f$ is continuous at $(0,0)$.

CONTINUITY
Example Let $f(x, y)=\left\{\begin{array}{cll}\frac{\sin \left(x^{2}+y^{2}\right)}{x^{2}+y^{2}} & : & (x, y) \neq(0,0) \\ 1 & : & (x, y)=(0,0)\end{array}\right.$
Show that $f$ is continuous at $(0,0)$.
(1) $f(0,0)=1$ is defined
(2) $\lim _{(x, y) \rightarrow(0,0)} f(x, y)=\lim _{(x, y) \rightarrow(0,0)} \frac{\sin \left(x^{2}+y^{2}\right)}{\left(x^{2}+y^{2}\right)}$

$$
\begin{aligned}
& =\lim _{r \rightarrow 0^{+}} \frac{\sin \left(r^{2}\right)}{\left(r^{2}\right)} \\
& =1=f(0,0)
\end{aligned}
$$

## Course: Calculus (3)

Chapter: [13]<br>PARTIAL DERIVATIVES

Section: [13.3]
PARTIAL DERIVATIVES

## PARTIAL DERIVATIVES OF FUNCTIONS OF TWO VARIABLES

- How will the value of a function be affected by a change in one of its independent variables?
- The procedure used to determine the rate of change of a function $f(x, y)$ with respect to one of its several independent variables is called partial differentiation, and the result is referred to as the partial derivative of $f$ with respect to the chosen independent variable.

## PARTIAL DERIVATIVES OF FUNCTIONS OF TWO VARIABLES

## Definition of Partial Derivatives of a Function of Two Variables

If $z=f(x, y)$, then the first partial derivatives of $f$ with respect to $x$ and $y$ are the functions $f_{x}$ and $f_{y}$ defined by

$$
f_{x}(x, y)=\lim _{\Delta x \rightarrow 0} \frac{f(x+\Delta x, y)-f(x, y)}{\Delta x}
$$

and

$$
f_{y}(x, y)=\lim _{\Delta y \rightarrow 0} \frac{f(x, y+\Delta y)-f(x, y)}{\Delta y}
$$

provided the limits exist.

## PARTIAL DERIVATIVES OF FUNCTIONS OF TWO VARIABLES

NOTE This previous definition indicates that if $z=f(x, y)$ then:
$\checkmark$ To find $f_{x}$ you consider $y$ constant and differentiate with respect
to $x$.
$\checkmark$ Similarly, to find $f_{y}$ you consider $x$ constant and differentiate with respect to $y$.

## THE PARTIAL DERIVATIVE FUNCTIONS

Example Find $f_{x}(x, y)$ and $f_{y}(x, y)$ for $f(x, y)=2 x^{3} y^{2}+2 y+4 x$ and use those partial derivatives to compute $f_{x}(1,3)$ and $f_{y}(1,3)$.

Keeping $y$ fixed (constant) and differentiating with respect to $x$ yields

$$
f_{x}(x, y)=\frac{d}{d x}\left[2 x^{3} y^{2}+2 y+4 x\right]=6 x^{2} y^{2}+4
$$

and keeping $x$ fixed (constant) and differentiating with respect to $y$ yields

$$
f_{y}(x, y)=\frac{d}{d y}\left[2 x^{3} y^{2}+2 y+4 x\right]=4 x^{3} y+2
$$

Thus, $f_{x}(1,3)=6\left(1^{2}\right)\left(3^{2}\right)+4=58$

$$
f_{y}(1,3)=4\left(1^{3}\right)(3)+2=14
$$

## PARTIAL DERIVATIVE NOTATION

For $z=f(x, y)$, the partial derivatives $f_{x}$ and $f_{y}$ are denoted by

$$
\frac{\partial}{\partial x} f(x, y)=f_{x}(x, y)=z_{x}=\frac{\partial z}{\partial x}
$$

and

$$
\frac{\partial}{\partial y} f(x, y)=f_{y}(x, y)=z_{y}=\frac{\partial z}{\partial y}
$$

Partial derivative with respect to $y$
The first partials evaluated at the point $(a, b)$ are denoted by

$$
\left.\frac{\partial z}{\partial x}\right|_{(a, b)}=f_{x}(a, b) \quad \text { and }\left.\quad \frac{\partial z}{\partial y}\right|_{(a, b)}=f_{y}(a, b) .
$$

## PARTIAL DERIVATIVE NOTATION

Example Find $\frac{\partial z}{\partial x}$ and $\frac{\partial z}{\partial y}$ if $z=x^{4} \sin \left(x y^{3}\right)$.

$$
\begin{aligned}
\frac{\partial z}{\partial x} & =\frac{\partial}{\partial x}\left[x^{4} \sin \left(x y^{3}\right)\right] \\
& =x^{4} \frac{\partial}{\partial x}\left[\sin \left(x y^{3}\right)\right]+\sin \left(x y^{3}\right) \frac{\partial}{\partial x}\left[x^{4}\right] \\
& =x^{4} y^{3} \cos \left(x y^{3}\right)+4 x^{3} \sin \left(x y^{3}\right)
\end{aligned}
$$

## PARTIAL DERIVATIVE NOTATION

Example Find $\frac{\partial z}{\partial x}$ and $\frac{\partial z}{\partial y}$ if $z=x^{4} \sin \left(x y^{3}\right)$.

$$
\begin{aligned}
& \frac{\partial z}{\partial y}=\frac{\partial}{\partial y}\left[x^{4} \sin \left(x y^{3}\right)\right] \\
& =x^{4} \frac{\partial}{\partial y}\left[\sin \left(x y^{3}\right)\right]=x^{4} \times 3 x y^{2} \cos \left(x y^{3}\right) \\
& =3 x^{5} y^{2} \cos \left(x y^{3}\right)
\end{aligned}
$$

## PARTIAL DERIVATIVE NOTATION

Example Find $f_{x}(1, \ln 2)$ and $f_{y}(1, \ln 2)$ if $f(x, y)=y e^{x^{2} y}$.

$$
\begin{aligned}
& f_{x}=\frac{\partial}{\partial x}\left[y e^{x^{2} y}\right] \\
& \\
& =y \frac{\partial}{\partial x}\left[e^{x^{2} y}\right]=y \times 2 x y e^{x^{2} y}=2 x y^{2} e^{x^{2} y} \\
& \therefore f_{x}(1, \ln 2)=2(1)(\ln 2)^{2} e^{\left(1^{2}\right) \ln 2} \\
&
\end{aligned}
$$

## PARTIAL DERIVATIVE NOTATION

Example Find $f_{x}(1, \ln 2)$ and $f_{y}(1, \ln 2)$ if $f(x, y)=y e^{x^{2} y}$.

$$
\begin{gathered}
f_{y}=\frac{\partial}{\partial y}\left[y e^{x^{2} y}\right]=y \frac{\partial}{\partial y}\left[e^{x^{2} y}\right]+e^{x^{2} y} \frac{\partial}{\partial y}[y] \\
=y x^{2} e^{x^{2} y}+e^{x^{2} y}=\left(y x^{2}+1\right) e^{x^{2} y} \\
\therefore f_{y}(1, \ln 2)=\left(\left(1^{2}\right) \ln 2+1\right) e^{\left(1^{2}\right) \ln 2} \\
=2 \ln 2+2
\end{gathered}
$$

## PARTIAL DERIVATIVES VIEWED AS SLOPES

The values of $f_{x}$ and $f_{y}$ at the point $\left(x_{0}, y_{0}, z_{0}\right)$ denote the slopes of the surface in the $x$ - and $y$-directions, respectively.

## PARTIAL DERIVATIVES VIEWED AS SLOPES

Example Let $f(x, y)=x^{2} y+5 y^{3}$.
a) Find the slope of the surface $f(x, y)$ in the $x$-direction at the point $(1,-2)$.
$\because f_{x}(x, y)=2 x y$
Thus, the slope in the $x$-direction is $f_{x}(1,-2)=-4$
b) Find the slope of the surface $f(x, y)$ in the $y$-direction at the point $(1,-2)$.

$$
\because f_{y}(x, y)=x^{2}+15 y^{2}
$$

Thus, the slope in the $y$-direction is $f_{y}(1,-2)=61$

## IMPLICIT PARTIAL DIFFERENTIATION

Example Find the slope of the sphere $x^{2}+y^{2}+z^{2}=1$ in the $y$-direction at the point $\left(\frac{2}{3}, \frac{1}{3}, \frac{2}{3}\right)$.

$$
\begin{aligned}
\frac{\partial}{\partial y}\left[x^{2}+y^{2}+z^{2}\right] & =\frac{\partial}{\partial y}[1] & \left.\frac{\partial z}{\partial y}\right|_{\left(\frac{2}{3}, \frac{1}{3}, \frac{2}{3}\right)} & =-\frac{1 / 3}{2 / 3} \\
2 y+2 z \frac{\partial z}{\partial y} & =0 & & =-\frac{1}{2} \\
\frac{\partial z}{\partial y} & =-\frac{y}{z} & &
\end{aligned}
$$

## PARTIAL DERIVATIVES OF FUNCTIONS WITH MORE THAN TWO VARIABLES

- For a function $w=f(x, y, z)$ of three variables, there are three partial derivatives:

$$
\frac{\partial w}{\partial x}=f_{x} \quad, \quad \frac{\partial w}{\partial y}=f_{y} \quad, \quad \frac{\partial w}{\partial z}=f_{z}
$$

- The partial derivative $f_{x}$ is calculated by holding $y$ and $z$ constant and differentiating with respect to $x$.
- For $f_{y}$ the variables $x$ and $z$ are held constant,
- and for $f_{z}$ the variables $x$ and $y$ are held constant.

## PARTIAL DERIVATIVES OF FUNCTIONS WITH MORE THAN TWO VARIABLES

Example If $f(x, y, z)=x^{3} y^{2} z^{4}+2 x y+z$, then

$$
\begin{aligned}
& f_{x}(x, y, z)=3 x^{2} y^{2} z^{4}+2 y \\
& f_{y}(x, y, z)=2 x^{3} y z^{4}+2 x \\
& f_{z}(x, y, z)=4 x^{3} y^{2} z^{3}+1
\end{aligned}
$$

Example If $f(x, y, z, w)=\frac{x+y+z}{w}$, then $\frac{\partial f}{\partial w}=-\frac{x+y+z}{w^{2}}$

## PARTIAL DERIVATIVES OF FUNCTIONS WITH MORE THAN TWO VARIABLES

Example If $w=\frac{x^{2}-z^{2}}{y^{2}+z^{2}}$, then

$$
\begin{aligned}
\frac{\partial w}{\partial z} & =\frac{\left(y^{2}+z^{2}\right)(-2 z)-\left(x^{2}-z^{2}\right)(2 z)}{\left(y^{2}+z^{2}\right)^{2}} \\
& =\frac{-2 z\left(x^{2}+y^{2}\right)}{\left(y^{2}+z^{2}\right)^{2}}
\end{aligned}
$$

## HIGHER-ORDER PARTIAL DERIVATIVES

$\checkmark$ Suppose that $f$ is a function of two variables $x$ and $y$.
$\checkmark$ Since the partial derivatives $f_{x}$ and $f_{y}$ are also functions of $x$ and $y$, these functions may themselves have partial derivatives.
$\checkmark$ This gives rise to four possible second-order partial derivatives of $f$, which are defined by

$$
\frac{\partial^{2} f}{\partial x \partial y}=\frac{\partial}{\partial x}\left(\frac{\partial f}{\partial y}\right)=f_{y x}
$$

> Differentiate first with respect to $y$ and then with respect to $x$.

$$
\begin{array}{ll}
\frac{\partial^{2} f}{\partial x^{2}}=\frac{\partial}{\partial x}\left(\frac{\partial f}{\partial x}\right)=f_{x x} & \frac{\partial^{2} f}{\partial y^{2}}=\frac{\partial}{\partial y}\left(\frac{\partial f}{\partial y}\right)=f_{y y}
\end{array} \quad \frac{\partial^{2} f}{\partial y \partial x}=\frac{\partial}{\partial y}\left(\frac{\partial f}{\partial x}\right)=f_{x y} . \begin{aligned}
& \text { Differentiate first with } \\
& \text { respect to } x \text { and then } \\
& \text { with respect to } y .
\end{aligned}
$$

## HIGHER-ORDER PARTIAL DERIVATIVES

- The last two cases are called the mixed second-order partial derivatives or the mixed second partials.
- Observe that the two notations for the mixed

$$
\frac{\partial^{2} f}{\partial x \partial y}=\frac{\partial}{\partial x}\left(\frac{\partial f}{\partial y}\right)=f_{y x}
$$

$$
\begin{aligned}
& \text { Differentiate first with } \\
& \text { respect to } y \text { and then } \\
& \text { with respect to } x \text {. }
\end{aligned}
$$

second partials have opposite conventions for the order of differentiation.

- Let $f$ be a function of two variables. If $f_{x y}$ and $f_{y x}$ are continuous on some open disk, then $f_{x y}=f_{y x}$ on that disk.

$$
\frac{\partial^{2} f}{\partial y \partial x}=\frac{\partial}{\partial y}\left(\frac{\partial f}{\partial x}\right)=f_{x y}
$$

## HIGHER-ORDER PARTIAL DERIVATIVES

## Example

Find the second-order partial derivatives of

$$
f(x, y)=x^{2} y^{3}+x^{4} y
$$

$$
\begin{aligned}
& f_{x}(x, y)=2 x y^{3}+4 x^{3} y \\
& f_{y}(x, y)=3 x^{2} y^{2}+x^{4}
\end{aligned}
$$

$$
\begin{aligned}
& f_{x x}=\frac{\partial^{2} f}{\partial x^{2}}=\frac{\partial}{\partial x}\left(\frac{\partial f}{\partial x}\right)=\frac{\partial}{\partial x}\left(2 x y^{3}+4 x^{3} y\right)=2 y^{3}+12 x^{2} y \\
& f_{y y}=\frac{\partial^{2} f}{\partial y^{2}}=\frac{\partial}{\partial y}\left(\frac{\partial f}{\partial y}\right)=\frac{\partial}{\partial y}\left(3 x^{2} y^{2}+x^{4}\right)=6 x^{2} y \\
& f_{x y}=\frac{\partial^{2} f}{\partial y \partial x}=\frac{\partial}{\partial y}\left(\frac{\partial f}{\partial x}\right)=\frac{\partial}{\partial y}\left(2 x y^{3}+4 x^{3} y\right)=6 x y^{2}+4 x^{3}=f_{y x}
\end{aligned}
$$

## HIGHER-ORDER PARTIAL DERIVATIVES

Third-order, fourth-order, and higher-order partial derivatives can be obtained by successive differentiation. Some possibilities are

$$
\begin{aligned}
\frac{\partial^{3} f}{\partial x^{3}} & =\frac{\partial}{\partial x}\left(\frac{\partial^{2} f}{\partial x^{2}}\right)=f_{x x x} & \frac{\partial^{4} f}{\partial y^{4}} & =\frac{\partial}{\partial y}\left(\frac{\partial^{3} f}{\partial y^{3}}\right)=f_{y y y y} \\
\frac{\partial^{3} f}{\partial y^{2} \partial x} & =\frac{\partial}{\partial y}\left(\frac{\partial^{2} f}{\partial y \partial x}\right)=f_{x y y} & \frac{\partial^{4} f}{\partial y^{2} \partial x^{2}} & =\frac{\partial}{\partial y}\left(\frac{\partial^{3} f}{\partial y \partial x^{2}}\right)=f_{x x y y}
\end{aligned}
$$

Example Let $f(x, y)=y^{2} e^{x}+y$. Find $f_{x y y}$.

$$
f_{x y y}=\frac{\partial^{3} f}{\partial y^{2} \partial x}=\frac{\partial^{2}}{\partial y^{2}}\left(\frac{\partial f}{\partial x}\right)=\frac{\partial^{2}}{\partial y^{2}}\left(y^{2} e^{x}\right)=\frac{\partial}{\partial y}\left(2 y e^{x}\right)=2 e^{x}
$$

## PARTIAL DERIVATIVES AND CONTINUITY

In contrast to the case of functions of a single variable, the existence of partial derivatives for a multivariable function does not guarantee the continuity of the function.
Example Let $f(x, y)=\left\{\begin{array}{cll}-\frac{x y}{x^{2}+y^{2}} & :(x, y) \neq(0,0) \\ 0 & : & (x, y)=(0,0)\end{array}\right.$
We previously show that $\lim _{(x, y) \rightarrow(0,0)}-\frac{x y}{x^{2}+y^{2}}$ does not exist.
$\therefore f(x, y)$ is discontinuous at $(0,0)$.

## PARTIAL DERIVATIVES AND CONTINUITY

Example Let $f(x, y)=\left\{\begin{array}{cll}-\frac{x y}{x^{2}+y^{2}} & : & (x, y) \neq(0,0) \\ 0 & : & (x, y)=(0,0)\end{array}\right.$
$\therefore f(x, y)$ is discontinuous at $(0,0)$.
We will have to use the definitions of the partial derivatives to determine whether $f$ has partial derivatives at $(0,0)$, and if so, we find the values of those derivatives.

$$
\begin{aligned}
& f_{x}(0,0)=\lim _{\Delta x \rightarrow 0} \frac{f(\Delta x, 0)-f(0,0)}{\Delta x}=\lim _{\Delta x \rightarrow 0} \frac{0-0}{\Delta x}=0 \\
& f_{y}(0,0)=\lim _{\Delta y \rightarrow 0} \frac{f(0, \Delta y)-f(0,0)}{\Delta y}=\lim _{\Delta y \rightarrow 0} \frac{0-0}{\Delta y}=0
\end{aligned}
$$

## PARTIAL DERIVATIVES AND CONTINUITY

Example Let $f(x, y)=\left\{\begin{array}{cll}-\frac{x y}{x^{2}+y^{2}} & :(x, y) \neq(0,0) \\ 0 & : & (x, y)=(0,0)\end{array}\right.$
$\therefore f(x, y)$ is discontinuous at $(0,0)$.

$$
\begin{aligned}
& f_{x}(0,0)=\lim _{\Delta x \rightarrow 0} \frac{f(\Delta x, 0)-f(0,0)}{\Delta x}=\lim _{\Delta x \rightarrow 0} \frac{0-0}{\Delta x}=0 \\
& f_{y}(0,0)=\lim _{\Delta y \rightarrow 0} \frac{f(0, \Delta y)-f(0,0)}{\Delta y}=\lim _{\Delta y \rightarrow 0} \frac{0-0}{\Delta y}=0
\end{aligned}
$$

This shows that $f$ has partial derivatives at $(0,0)$ and the values of both partial derivatives are $\mathbf{0}$ at that point.

Section: [13.5]
THE CHAIN RULE

## CHAIN RULES FOR DERIVATIVES

If $y$ is a differentiable function of $x$ and $x$ is a differentiable function of $t$, then the chain rule for functions of one variable states that, under composition, $y$ becomes a differentiable function of $t$ with

$$
\frac{d y}{d t}=\frac{d y}{d x} \frac{d x}{d t}
$$

## CHAIN RULES FOR DERIVATIVES

- Let $w=f(x, y)$ where $f$ is a differentiable function of $x$ and $y$.
- If $x=g(t)$ and $y=h(t)$ where $g$ and $h$ are differentiable functions of $t$ then $w$ is a
 differentiable function of $t$.
- And

$$
\frac{d w}{d t}=\frac{\partial w}{\partial x} \frac{d x}{d t}+\frac{\partial w}{\partial y} \frac{d y}{d t}
$$

## CHAIN RULES FOR DERIVATIVES

Example Let $w=x^{2} y-y^{2}$, where $x=\sin t$ $\frac{d w}{d t}=\frac{\partial w}{\partial x} \frac{d x}{d t}+\frac{\partial w}{\partial y} \frac{d y}{d t}$ and $y=e^{t}$. Find $\frac{d w}{d t}$ when $t=0$.

$$
\frac{d w}{d t}=\frac{\partial w}{\partial x} \frac{d x}{d t}+\frac{\partial w}{\partial y} \frac{d y}{d t}
$$

$$
=(2 x y)(\cos t)+\left(x^{2}-2 y\right)\left(e^{t}\right)
$$

$$
=\left(2 \sin t e^{t}\right)(\cos t)+\left(\sin ^{2} t-2 e^{t}\right)\left(e^{t}\right)
$$

$$
\left.\frac{d w}{d t}\right|_{t=0}=-2
$$

NOTE $w=e^{t} \sin ^{2} t-e^{2 t}$

## CHAIN RULES FOR DERIVATIVES

Example Let $w=x y+y z$, where $y=\sin x$ and $z=e^{x}$. Use an appropriate form of the chain rule to find $d w / d x$.

$$
\begin{aligned}
\frac{d w}{d x} & =\frac{\partial w}{\partial x}+\frac{\partial w}{\partial y} \frac{d y}{d x}+\frac{\partial w}{\partial z} \frac{d z}{d x} \\
& =y+(x+z)(\cos x)+(y)\left(e^{x}\right) \\
& =\left(1+e^{x}\right) \sin x+\left(x+e^{x}\right) \cos x
\end{aligned}
$$

## NOTE

$$
w=x \sin x+e^{x} \sin x
$$

## CHAIN RULES FOR DERIVATIVES

Example Given that $z=e^{x y}, x=2 u+v$, and $y=u / v$. Find $\partial z / \partial u$ and $\partial z / \partial v$.

$$
\frac{\partial z}{\partial u}=\frac{\partial z}{\partial x} \frac{\partial x}{\partial u}+\frac{\partial z}{\partial y} \frac{\partial y}{\partial u}
$$

$$
=\left(y e^{x y}\right)(2)+\left(x e^{x y}\right)(1 / v)=e^{x y}\left(2 y+\frac{x}{v}\right)=e^{(2 u+v)(u / v)}\left(1+\frac{4 u}{v}\right)
$$

$$
\begin{aligned}
\frac{\partial z}{\partial v} & =\frac{\partial z}{\partial x} \frac{\partial x}{\partial v}+\frac{\partial z}{\partial y} \frac{\partial y}{\partial v} \\
& =\left(y e^{x y}\right)(1)+\left(x e^{x y}\right)\left(-u / v^{2}\right)=e^{x y}\left(y-\frac{x u}{v^{2}}\right)=-\frac{2 u^{2}}{v^{2}} e^{(2 u+v)(u / v)}
\end{aligned}
$$

## CHAIN RULES FOR DERIVATIVES

## Example

Given that $w=x^{2}+y^{2}-z^{2}$, and

$$
\begin{aligned}
& x=\rho \sin \phi \cos \theta \\
& y=\rho \sin \phi \sin \theta \\
& z=\rho \cos \phi
\end{aligned}
$$

Use appropriate forms of the

 chain rule to find $\partial w / \partial \theta$.
$\frac{\partial w}{\partial \theta}=\frac{\partial w}{\partial x} \frac{\partial x}{\partial \theta}+\frac{\partial w}{\partial y} \frac{\partial y}{\partial \theta}=(2 x)(-\rho \sin \phi \sin \theta)+(2 y)(\rho \sin \phi \cos \theta)$
$=0 \quad$ This result is explained by the fact that $w$ does not vary with $\theta$.

## CHAIN RULES FOR DERIVATIVES

Example Let $f$ be a differentiable function of one variable and let $z=f(x+2 y)$. Show that

$$
2 \frac{\partial z}{\partial x}-\frac{\partial z}{\partial y}=0
$$

Let $u=x+2 y$

$$
\frac{\partial z}{\partial x}=\frac{d z}{d u} \frac{\partial u}{\partial x}=\frac{d z}{d u}(1)=\frac{d z}{d u}
$$

$$
\frac{\partial z}{\partial y}=\frac{d z}{d u} \frac{\partial u}{\partial y}=\frac{d z}{d u}(2)=2 \frac{d z}{d u}
$$

$$
2 \frac{\partial z}{\partial x}-\frac{\partial z}{\partial y}=2 \frac{d z}{d u}-2 \frac{d z}{d u}=0
$$

## IMPLICIT DIFFERENTIATION

Consider the special case where $f(x, y)$ is a function of $x$ and $y$ and $y$ is a differentiable function of $x$.

$$
\frac{d f}{d x}=\frac{\partial f}{\partial x}+\frac{\partial f}{\partial y} \frac{d y}{d x}
$$

Now, suppose that $f(x, y)=c$. Then

$$
\begin{aligned}
0 & =\frac{\partial f}{\partial x}+\frac{\partial f}{\partial y} \frac{d y}{d x} \\
\frac{d y}{d x} & =-\frac{\partial f / \partial x}{\partial f / \partial y}
\end{aligned}
$$

## IMPLICIT DIFFERENTIATION

$\frac{d y}{d x}=-\frac{\partial f / \partial x}{\partial f / \partial y}$

Example Given that $x^{3}+y^{2} x-3=0$, find $\frac{d y}{d x}$

$$
\underbrace{x^{3}+y^{2} x}=3
$$

$$
f(x, y)
$$

$$
\frac{d y}{d x}=-\frac{3 x^{2}+y^{2}}{2 x y}
$$

## Course: Calculus (3)

Chapter: [13]
PARTIAL DERIVATIVES
Section: [13.6]
DIRECTIONAL DERIVATIVES AND GRADIENTS

## DIRECTIONAL DERIVATIVES

- In this section we extend the concept of a partial derivative to the more general notion of a directional derivative.
- You will see that $f_{x}(x, y)$ and $f_{y}(x, y)$ can be used to find the slope in any direction.
- To determine the slope at a point on a surface, you will define a new type of derivative called a directional derivative.

## DIRECTIONAL DERIVATIVES

- To do this is to use a unit vector

$$
\mathbf{u}=u_{1} \mathbf{i}+u_{2} \mathbf{j}
$$

that has its initial point at $\left(x_{0}, y_{0}\right)$ and points in the desired direction.

## DIRECTIONAL DERIVATIVES

If $f(x, y)$ is a function of $x$ and $y$, and if $\mathbf{u}=u_{1} \mathbf{i}+u_{2} \mathbf{j}$ is a unit vector, then the directional derivative of $f$ in the direction of $\mathbf{u}$ at $\left(x_{0}, y_{0}\right)$ is denoted by $D_{\mathbf{u}} f\left(x_{0}, y_{0}\right)$ and is defined by

$$
D_{\mathbf{u}} f\left(x_{0}, y_{0}\right)=f_{x}\left(x_{0}, y_{0}\right) u_{1}+f_{y}\left(x_{0}, y_{0}\right) u_{2}
$$

## DIRECTIONAL DERIVATIVES

Example Find the directional derivative of $f(x, y)=e^{x y}$ at $(-2,0)$ in the direction of the unit vector that makes an angle of $\pi / 3$ with the positive $x$-axis.

$$
\begin{array}{lll}
f_{x}(x, y)=y e^{x y} & f_{y}(x, y)=x e^{x y} & \mathbf{u}=\cos \frac{\pi}{3} \mathbf{i}+\sin \frac{\pi}{3} \mathbf{j} \\
f_{x}(-2,0)=0 & f_{y}(-2,0)=-2 & \mathbf{u}=\frac{1}{2} \mathbf{i}+\frac{\sqrt{3}}{2} \mathbf{j}
\end{array}
$$

$$
\begin{aligned}
D_{\mathbf{u}} f(-2,0) & =f_{x}(-2,0) u_{1}+f_{y}(-2,0) u_{2} \\
& =(0)\left(\frac{1}{2}\right)+(-2)\left(\frac{\sqrt{3}}{2}\right)=-\sqrt{3}
\end{aligned}
$$

## DIRECTIONAL DERIVATIVES

Example Find the directional derivative of $f(x, y, z)=x^{2} y-y z^{3}+z$ at $(1,-2,0)$ in the direction of the vector $\mathbf{a}=2 \mathbf{i}+\mathbf{j}-2 \mathbf{k}$.

$$
\begin{array}{ll}
f_{x}(x, y, z)=2 x y & \mathbf{u}=\frac{\mathbf{a}}{\|\mathbf{a}\|}
\end{array}=\frac{2 \mathbf{i}+\mathbf{j}-2 \mathbf{k}}{\sqrt{2^{2}+1^{2}+(-2)^{2}}}
$$

$$
f_{x}(1,-2,0)=-4
$$

$$
f_{y}(1,-2,0)=1
$$

$$
f_{z}(1,-2,0)=1
$$

## DIRECTIONAL DERIVATIVES

Example Find the directional derivative of $f(x, y, z)=x^{2} y-y z^{3}+z$ at $(1,-2,0)$ in the direction of the vector $\mathbf{a}=2 \mathbf{i}+\mathbf{j}-2 \mathbf{k}$.

$$
f_{x}(1,-2,0)=-4 \quad f_{y}(1,-2,0)=1 \quad f_{z}(1,-2,0)=1
$$

$$
\mathbf{u}=\frac{\mathbf{a}}{\|\mathbf{a}\|}=\frac{2}{3} \mathbf{i}+\frac{1}{3} \mathbf{j}-\frac{2}{3} \mathbf{k}
$$

$$
D_{\mathbf{u}} f(1,-2,0)=f_{x}(1,-2,0) u_{1}+f_{y}(1,-2,0) u_{2}+f_{z}(1,-2,0) u_{3}
$$

$$
=(-4)\left(\frac{2}{3}\right)+(1)\left(\frac{1}{3}\right)+(1)\left(\frac{-2}{3}\right)=-3
$$

## THE GRADIENT

(a) If $f$ is a function of $x$ and $y$, then the gradient off is defined by

$$
\nabla f(x, y)=f_{x}(x, y) \mathbf{i}+f_{y}(x, y) \mathbf{j}
$$

(b) If $f$ is a function of $x, y$, and $z$, then the gradient of $f$ is defined by

$$
\nabla f(x, y, z)=f_{x}(x, y, z) \mathbf{i}+f_{y}(x, y, z) \mathbf{j}+f_{z}(x, y, z) \mathbf{k}
$$

NOTE

$$
\begin{aligned}
D_{\mathbf{u}} f\left(x_{0}, y_{0}\right) & =f_{x}\left(x_{0}, y_{0}\right) u_{1}+f_{y}\left(x_{0}, y_{0}\right) u_{2} \\
& =\left\langle f_{x}\left(x_{0}, y_{0}\right), f_{y}\left(x_{0}, y_{0}\right)\right\rangle \cdot\left\langle u_{1}, u_{2}\right\rangle \\
& =\nabla f \cdot \mathbf{u}
\end{aligned}
$$

## PROPERTIES OF THE GRADIENT

Let $f$ be a function of either two variables or three variables and let $P$ denote the point $P\left(x_{0}, y_{0}\right)$ or $P\left(x_{0}, y_{0}, z_{0}\right)$, respectively. Assume that $f$ is differentiable at $P$.
a) If $\nabla f=\mathbf{0}$ at $P$, then all directional derivatives of $f$ at $P$ are zero.
b) If $\nabla f \neq \mathbf{0}$ at $P$, then among all possible directional derivatives of $f$ at $P$, the derivative in the direction of $\nabla f$ at $P$ has the largest value. The value of this largest directional derivative is $\|\nabla f\|$ at $P$.
c) If $\nabla f \neq \mathbf{0}$ at $P$, then among all possible directional derivatives of $f$ at $P$, the derivative in the opposite direction of $\nabla f$ at $P$ has the smallest value. The value of this smallest directional derivative is $-\|\nabla f\|$ at $P$.

## PROPERTIES OF THE GRADIENT

Example Let $f(x, y)=x^{2} e^{y}$. Find the maximum value of a directional derivative at $(-2,0)$, and find the unit vector in the direction in which the maximum value occurs.

$$
\begin{aligned}
& \nabla f(x, y)=f_{x}(x, y) \mathbf{i}+f_{y}(x, y) \mathbf{j}=2 x e^{y} \mathbf{i}+x^{2} e^{y} \mathbf{j} \\
& \nabla f(-2,0)=-4 \mathbf{i}+4 \mathbf{j}
\end{aligned}
$$

So, the maximum value of the directional derivative is

$$
\|\nabla f(-2,0)\|=\sqrt{(-4)^{2}+4^{2}}=4 \sqrt{2}
$$

## PROPERTIES OF THE GRADIENT

Example Let $f(x, y)=x^{2} e^{y}$. Find the maximum value of a directional derivative at $(-2,0)$, and find the unit vector in the direction in which the maximum value occurs.

So, the maximum value of the directional derivative is

$$
\|\nabla f(-2,0)\|=\sqrt{(-4)^{2}+4^{2}}=4 \sqrt{2}
$$

This maximum occurs in the direction of $\nabla f(-2,0)$.
The unit vector in this direction is

$$
\mathbf{u}=\frac{\nabla f(-2,0)}{\|\nabla f(-2,0)\|}=\frac{1}{4 \sqrt{2}}(-4 \mathbf{i}+4 \mathbf{j})=-\frac{1}{\sqrt{2}} \mathbf{i}+\frac{1}{\sqrt{2}} \mathbf{j}
$$

## Course: Calculus (3)

Chapter: [13]<br>PARTIAL DERIVATIVES

Section: [13.7]
TANGENT PLANES AND NORMAL VECTORS
tangent planes and normal vectors to level surfaces $F(x, y, z)=c$

In this section we will discuss "How do we find equations of tangent planes to surfaces in three-dimensional space?"

- Let $S$ be a surface given by $F(x, y, z)=0$ and let $P\left(x_{0}, y_{0}, z_{0}\right)$ be a point on $S$.

## TANGENT PLANES AND NORMAL VECTORS TO LEVEL SURFACES

 $\boldsymbol{F}(\boldsymbol{x}, \boldsymbol{y}, \mathrm{z})=\boldsymbol{c}$
## Definitions of Tangent Plane and Normal Line

Let $F$ be differentiable at the point $P\left(x_{0}, y_{0}, z_{0}\right)$ on the surface $S$ given by $F(x, y, z)=0$ such that

$$
\nabla F\left(x_{0}, y_{0}, z_{0}\right) \neq \mathbf{0} .
$$

1. The plane through $P$ that is normal to $\nabla F\left(x_{0}, y_{0}, z_{0}\right)$ is called the tangent plane to $S$ at $P$.
2. The line through $P$ having the direction of $\nabla F\left(x_{0}, y_{0}, z_{0}\right)$ is called the normal line to $S$ at $P$.

## Equation of Tangent Plane

If $F$ is differentiable at $\left(x_{0}, y_{0}, z_{0}\right)$, then an equation of the tangent plane to the surface given by $F(x, y, z)=0$ at $\left(x_{0}, y_{0}, z_{0}\right)$ is

$$
F_{x}\left(x_{0}, y_{0}, z_{0}\right)\left(x-x_{0}\right)+F_{y}\left(x_{0}, y_{0}, z_{0}\right)\left(y-y_{0}\right)+F_{z}\left(x_{0}, y_{0}, z_{0}\right)\left(z-z_{0}\right)=0 .
$$

## TANGENT PLANES AND NORMAL VECTORS TO LEVEL SURFACES

$F(x, y, z)=c$
Example Find an equation of the tangent plane to the hyperboloid $z^{2}-2 x^{2}-2 y^{2}=12$ at the point $(1,-1,4)$.

$$
\begin{aligned}
& z^{2}-2 x^{2}-2 y^{2}-12=0 \\
& F(x, y, z)=z^{2}-2 x^{2}-2 y^{2}-12
\end{aligned}
$$

$$
\begin{aligned}
& F_{x}(x, y, z)=-4 x \\
& F_{y}(x, y, z)=-4 y \\
& F_{z}(x, y, z)=2 z
\end{aligned}
$$

So, an equation of the tangent plane at $(1,-1,4)$ is

$$
\begin{aligned}
-4(x-1)+4(y+1)+8(z-4) & =0 \\
-4 x+4 y+8 z & =24 \\
x-y-2 z+6 & =0
\end{aligned}
$$

$$
\begin{aligned}
& F_{x}(1,-1,4)=-4 \\
& F_{y}(1,-1,4)=4 \\
& F_{z}(1,-1,4)=8
\end{aligned}
$$

## tangent planes and normal vectors to level surfaces

$$
F(x, y, z)=c
$$

Example Find an equation for the tangent plane and parametric equations for the normal line to the surface $z=x^{2} y$ at the point $(2,1,4)$.

$$
z-x^{2} y=0 \quad F(x, y, z)=z-x^{2} y
$$

$\nabla F(x, y, z)=-2 x y \mathbf{i}-x^{2} \mathbf{j}+\mathbf{k}$

$$
\nabla F(2,1,4)=-4 \mathbf{i}-4 \mathbf{j}+\mathbf{k}
$$

So, the tangent plane has equation

$$
\begin{array}{r}
-4(x-2)-4(y-1)+(z-4)=0 \\
-4 x-4 y+z+8=0
\end{array}
$$

## Course: Calculus (3)

## Chapter: [13] <br> PARTIAL DERIVATIVES <br> Section: [13.8] <br> MAXIMA AND MINIMA OF FUNCTIONS OF TWO VARIABLES

## EXTREMA

- A function $f$ of two variables is said to have a relative maximum at a point $\left(x_{0}, y_{0}\right)$ if there is a disk centered at $\left(x_{0}, y_{0}\right)$ such that $f\left(x_{0}, y_{0}\right) \geq f(x, y)$ for all points $(x, y)$ that lie inside the disk.
- And $f$ is said to have an absolute maximum at $\left(x_{0}, y_{0}\right)$ if $f\left(x_{0}, y_{0}\right) \geq f(x, y)$ for all points $(x, y)$ in the domain of $f$.

Absolute minimum

## EXTREMA

- A function $f$ of two variables is said to have a relative minimum at a point $\left(x_{0}, y_{0}\right)$ if there is a disk centered at $\left(x_{0}, y_{0}\right)$ such that $f\left(x_{0}, y_{0}\right) \leq f(x, y)$ for all points $(x, y)$ that lie inside the disk.
- And $f$ is said to have an absolute minimum at $\left(x_{0}, y_{0}\right)$ if $f\left(x_{0}, y_{0}\right) \leq f(x, y)$ for all points $(x, y)$ in the domain of $f$.

Absolute minimum

## BOUNDED SETS

A set of points in $2-$ space is called bounded if the entire set can be contained within some rectangle.

And is called unbounded if there is no rectangle that contains all the points of the set.

## THE EXTREME-VALUE THEOREM

If $f(x, y)$ is continuous on a closed and bounded set $R$, then $f$ has both an absolute maximum and an absolute minimum on $R$.

NOTE If any of the conditions in the Extreme-Value Theorem fail to hold, then there is no guarantee that an absolute maximum or absolute minimum exists on the region $R$.

## FINDING RELATIVE EXTREMA

## Definition of Critical Point

Let $f$ be defined on an open region $R$ containing $\left(x_{0}, y_{0}\right)$. The point $\left(x_{0}, y_{0}\right)$ is a critical point of $f$ if one of the following is true.

1. $f_{x}\left(x_{0}, y_{0}\right)=0$ and $f_{y}\left(x_{0}, y_{0}\right)=0$
2. $f_{x}\left(x_{0}, y_{0}\right)$ or $f_{y}\left(x_{0}, y_{0}\right)$ does not exist.

NOTE If $f$ is differentiable and

$$
\nabla f\left(x_{0}, y_{0}\right)=f_{x}\left(x_{0}, y_{0}\right) \mathbf{i}+f_{y}\left(x_{0}, y_{0}\right) \mathbf{j}=0 \mathbf{i}+0 \mathbf{j}=\mathbf{0}
$$

then every directional derivative at $\left(x_{0}, y_{0}\right)$ must be 0 .

## FINDING RELATIVE EXTREMA

## Relative Extrema Occur Only at Critical Points

If $f$ has a relative extremum at $\left(x_{0}, y_{0}\right)$ on an open region $R$, then $\left(x_{0}, y_{0}\right)$ is a critical point of $f$.

## FINDING RELATIVE EXTREMA

Example Find the critical value(s) of $f(x, y)=2 x^{2}+y^{2}+8 x-6 y+20$.

$$
\begin{array}{ll}
f_{x}(x, y)=4 x+8=0 & x=-2 \\
f_{y}(x, y)=2 y-6=0 & y=3
\end{array}
$$

The critical point is $(-2,3)$.
From the figure, $f$ has a relative minimum at $(-2,3)$, and the value of this relative minimum is $f(-2,3)=3$.

## FINDING RELATIVE EXTREMA

Example Find the critical value(s) of $f(x, y)=1-\left(x^{2}+y^{2}\right)^{1 / 3}$.
$f_{x}(x, y)=0-\frac{1}{3}\left(x^{2}+y^{2}\right)^{-2 / 3}(2 x)=\frac{-2 x}{3\left(x^{2}+y^{2}\right)^{2 / 3}}$

## FINDING RELATIVE EXTREMA

Example Find the critical value(s) of $f(x, y)=1-\left(x^{2}+y^{2}\right)^{1 / 3}$.
$f_{x}(x, y)=\frac{-2 x}{3\left(x^{2}+y^{2}\right)^{2 / 3}}$
$f_{y}(x, y)=\frac{-2 y}{3\left(x^{2}+y^{2}\right)^{2 / 3}}$
Both partial derivatives exist for all points in the $x y$-plane except for $(0,0)$.

The partial derivatives cannot both be 0 unless both $x$ and $y$ are 0 .

The only critical point is $(0,0)$.

From the figure, $f$ has a relative maximum at $(0,0)$, and the value of this relative minimum is $f(0,0)=1$.

## FINDING RELATIVE EXTREMA

Example Find the critical value(s) of $f(x, y)=y^{2}-x^{2}$.
$f_{x}(x, y)=-2 x=0 \quad x=0$
$f_{y}(x, y)=2 y=0 \quad y=0$

The critical point is $(0,0)$.

- The function $f$ has neither a relative maximum nor a relative minimum at $(0,0)$.
- The point $(0,0)$ is called a saddle point (نقطة سرج) of $f$.

## the second partials test

13.8.6 THEOREM (The Second Partials Test) Let $f$ be a function of two variables with continuous second-order partial derivatives in some disk centered at a critical point $\left(x_{0}, y_{0}\right)$, and let

$$
D=f_{x x}\left(x_{0}, y_{0}\right) f_{y y}\left(x_{0}, y_{0}\right)-f_{x y}^{2}\left(x_{0}, y_{0}\right)
$$

(a) If $D>0$ and $f_{x x}\left(x_{0}, y_{0}\right)>0$, then $f$ has a relative minimum at $\left(x_{0}, y_{0}\right)$.
(b) If $D>0$ and $f_{x x}\left(x_{0}, y_{0}\right)<0$, then $f$ has a relative maximum at $\left(x_{0}, y_{0}\right)$.
(c) If $D<0$, then $f$ has a saddle point at $\left(x_{0}, y_{0}\right)$.
(d) If $D=0$, then no conclusion can be drawn.

NOTE

$$
D=\left|\begin{array}{ll}
f_{x x}\left(x_{0}, y_{0}\right) & f_{x y}\left(x_{0}, y_{0}\right) \\
f_{x y}\left(x_{0}, y_{0}\right) & f_{y y}\left(x_{0}, y_{0}\right)
\end{array}\right|
$$

## THE SECOND PARTIALS TEST

Example $f(x, y)=2 x^{2}+y^{2}+8 x-6 y+20$.
The critical point is $(-2,3) . \quad f_{x x}(x, y)=4 \quad f_{x x}(-2,3)=4>0$
$\begin{array}{lll}f_{x}(x, y)=4 x+8 & f_{y y}(x, y)=2 & f_{y y}(-2,3)=2 \\ f_{y}(x, y)=2 y-6 & f_{x y}(x, y)=0 & f_{x y}(-2,3)=0\end{array}$
$D=f_{x x}(-2,3) f_{y y}(-2,3)-f_{x y}^{2}(-2,3)=(4)(2)-(0)^{2}=8>0$
$f$ has a relative minimum at $(-2,3)$ by the second partial test, and the value of this relative minimum is $f(-2,3)=3$.

## THE SECOND PARTIALS TEST

Example $f(x, y)=y^{2}-x^{2}$.
The critical point is $(0,0)$.
$f_{x}(x, y)=-2 x \quad f_{x x}(0,0)=-2$
$f_{y}(x, y)=2 y \quad f_{y y}(0,0)=2$
$f_{x y}(0,0)=0$
$D=f_{x x}(0,0) f_{y y}(0,0)-f_{x y}^{2}(0,0)=(-2)(2)-(0)^{2}=-4<0$
$f$ has a saddle point at $(0,0)$ by the second partial test.

## THE SECOND PARTIALS TEST

Example Locate all relative extrema and saddle points of

$$
f(x, y)=4 x y-x^{4}-y^{4}
$$

$$
\left.\begin{array}{lll}
f_{x}(x, y)=4 y-4 x^{3}=0 & y=x^{3} \\
f_{y}(x, y)=4 x-4 y^{3}=0 & x=y^{3}
\end{array}\right] \begin{aligned}
& x=\left(x^{3}\right)^{3}=x^{9} \\
& x^{9}-x=0
\end{aligned} \quad x\left(x^{8}-1\right)=0
$$

## THE SECOND PARTIALS TEST

Example Locate all relative extrema and saddle points of

\[

\]

## FINDING ABSOLUTE EXTREMA ON CLOSED AND BOUNDED SETS

Example Find the absolute maximum and minimum values of

$$
f(x, y)=3 x y-6 x-3 y+7
$$

on the closed triangular region $R$ with vertices ( 0,0 ), (3,0), and $(0,5)$.

## FINDING ABSOLUTE EXTREMA ON CLOSED AND BOUNDED SETS

Example Find the absolute maximum and minimum values of

$$
f(x, y)=3 x y-6 x-3 y+7
$$ on the closed triangular region $R$ with vertices ( 0,0 ), (3,0), and $(0,5)$.

1. Inside the region $\boldsymbol{R}$.

$$
\begin{aligned}
& \left.\begin{array}{l}
f_{x}(x, y)=3 y-6=0 \\
f_{y}(x, y)=3 x-3=0
\end{array}\right\} \quad(1,2) \text { is critical point } \\
& \begin{array}{l}
\text { Saddle Point }
\end{array} \\
& \begin{array}{l}
D=f_{x x}(1,2) f_{y y}(1,2)-f_{x y}^{2}(1,2) \\
\quad=(0)(0)-(3)^{2}=-9<0
\end{array}
\end{aligned}
$$

Bounded

## FINDING ABSOLUTE EXTREMA ON CLOSED AND BOUNDED SETS

Example Find the absolute maximum and minimum values of

$$
f(x, y)=3 x y-6 x-3 y+7
$$ on the closed triangular region $R$ with vertices ( 0,0 ), ( 3,0 ), and $(0,5)$.

2. On the line through the points $(0,0)$ and $(3,0)$.

$$
y=0 \quad f(x, 0)=-6 x+7
$$

## FINDING ABSOLUTE EXTREMA ON CLOSED AND BOUNDED SETS

Example Find the absolute maximum and minimum values of

$$
f(x, y)=3 x y-6 x-3 y+7
$$ on the closed triangular region $R$ with vertices ( 0,0 ), (3,0), and $(0,5)$.

2. On the line through the points $(0,0)$ and $(3,0)$. $y=0 \quad u(x)=-6 x+7 \quad ; \quad x \in[0,3]$

Since $u^{\prime}(x)=-6<0 \quad u(x)$ decreases on $[0,3]$

## Course: Calculus (3)

Chapter: [13]<br>PARTIAL DERIVATIVES

Section: [13.9]
LAGRANGE MULTIPLIERS

## extremum problems with Constraints

- In this section we will study a powerful new method for maximizing or minimizing a function subject to constraints on the variables.
- This method will help us to solve certain optimization problems that are difficult or impossible to solve using the methods studied in the last section.
- We wish to:

Find extrema of the function $z=f(x, y)$ subject to a constraint given by $g(x, y)=c$.

## extremum problems with Constraints

## Lagrange's Theorem

Let $f$ and $g$ have continuous first partial derivatives such that $f$ has an extremum at a point $\left(x_{0}, y_{0}\right)$ on the smooth constraint curve $g(x, y)=c$. If $\nabla g\left(x_{0}, y_{0}\right) \neq \mathbf{0}$, then there is a real number $\lambda$ such that

$$
\nabla f\left(x_{0}, y_{0}\right)=\lambda \nabla g\left(x_{0}, y_{0}\right)
$$

NOTE The scalar $\lambda$ is called a Lagrange multiplier.

## extremum problems with Constraints

## Method of Lagrange Multipliers

Let $f$ and $g$ satisfy the hypothesis of Lagrange's Theorem, and let $f$ have a minimum or maximum subject to the constraint $g(x, y)=c$. To find the minimum or maximum of $f$, use these steps.

1. Simultaneously solve the equations $\nabla f(x, y)=\lambda \nabla g(x, y)$ and $g(x, y)=c$ by solving the following system of equations.

$$
\begin{aligned}
f_{x}(x, y) & =\lambda g_{x}(x, y) \\
f_{y}(x, y) & =\lambda g_{y}(x, y) \\
g(x, y) & =c
\end{aligned}
$$

2. Evaluate $f$ at each solution point obtained in the first step. The greatest value yields the maximum of $f$ subject to the constraint $g(x, y)=c$, and the least value yields the minimum of $f$ subject to the constraint $g(x, y)=c$.

## extremum problems with Constraints

$$
g(x, y)=x+y-3
$$

Example At what point(s) on the line $x+y=3$ does

$$
f(x, y)=9-x^{2}-y^{2}
$$

have an absolute maximum, and what is that maximum?

$$
\begin{aligned}
f_{x}(x, y) & =\lambda g_{x}(x, y) & & -2 x=\lambda \\
f_{y}(x, y) & =\lambda g_{y}(x, y) & & -2 y=\lambda \\
g(x, y) & =0 & & x+y-3=0
\end{aligned} \longrightarrow-2 x=-2 y
$$

## extremum problems with Constraints

$$
g(x, y)=x+y-3
$$

Example At what point(s) on the line $x+y=3$ does

$$
f(x, y)=9-x^{2}-y^{2}
$$

have an absolute maximum, and what is that maximum?

$$
\begin{aligned}
& f_{x}(x, y)=\lambda g_{x}(x, y) \\
& f_{y}(x, y)=\lambda g_{y}(x, y) \\
& g(x, y)=0 \\
& \begin{array}{l}
-2 x=\lambda \\
-2 y=\lambda \\
x+y-3=0
\end{array} \\
& 2 x-3=0 \\
& x=\frac{3}{2} y=\frac{3}{2}
\end{aligned}
$$

## extremum problems with Constraints

Example At what point(s) on the line $x+y=3$ does

$$
f(x, y)=9-x^{2}-y^{2}
$$

have an absolute maximum, and what is that maximum?
$x=\frac{3}{2} y=\frac{3}{2}$

- Subject to the constraint $x+y=3$, the function $f$ has absolute maximum at $\left(\frac{3}{2}, \frac{3}{2}\right)$.
- The value of the absolute maximum is $f\left(\frac{3}{2}, \frac{3}{2}\right)=\frac{9}{2}$.

## extremum problems with Constraints

Example Use Lagrange multipliers to find the maximum and minimum values of

$$
f(x, y)=x-3 y-1
$$

subject to the constraint $x^{2}+3 y^{2}=16$.

$$
\begin{aligned}
f_{x}(x, y) & =\lambda g_{x}(x, y) & & 1=2 \lambda x \\
f_{y}(x, y) & =\lambda g_{y}(x, y) & & -3=6 \lambda y \\
g(x, y) & =0 & & x^{2}+3 y^{2}-16=0
\end{aligned}
$$

$$
g(x, y)=x^{2}+3 y^{2}-16
$$

## extremum problems with Constraints

Example Use Lagrange multipliers to find the maximum and minimum values of

$$
f(x, y)=x-3 y-1
$$

subject to the constraint $x^{2}+3 y^{2}=16$.

| $1=2 \lambda x$ | $x^{2}+3 y^{2}-16=0$ | $f(2,-2)=7$ |
| :---: | :---: | :---: |
| $\div$ | $4 x^{2}-16=0$ | $f(-2,2)=-9$ |
| $-3=6 \lambda y$ |  |  |
|  | $x=2 \rightarrow y=-2$ |  |
| $1$ | $x=-2 \longrightarrow y=2$ |  |

## extremum problems with Constraints

Example Find three positive numbers whose sum is 48 and such that their product is as large as possible.

Let the three numbers $x, y$ and $z$.
Constraint: $x+y+z=48$
Function: $f(x, y, z)=x y z$
Find the maximum value of $f(x, y, z)=x y z$ subject to the constraint $x+y+z=48$.

## extremum problems with Constraints

Example Find the maximum value of $f(x, y, z)=x y z$ subject to the constraint $x+y+z=48$.

$$
g(x, y, z)=x+y+z-48
$$

$$
\left.\begin{array}{rlrl}
f_{x}(x, y, z) & =\lambda g_{x}(x, y, z) & & y z=\lambda \\
f_{y}(x, y, z) & =\lambda g_{y}(x, y, z) & & x z=\lambda
\end{array}\right\} \frac{y}{x}=1
$$

## extremum problems with Constraints

Example Find the maximum value of $f(x, y, z)=x y z$ subject to the constraint $x+y+z=48$.

$$
g(x, y, z)=x+y+z-48
$$

$$
\left.\begin{array}{rlrl}
f_{x}(x, y, z) & =\lambda g_{x}(x, y, z) & & y z=\lambda \\
f_{y}(x, y, z) & =\lambda g_{y}(x, y, z) & & x z=\lambda
\end{array}\right\} y=x
$$

## extremum problems with Constraints

Example Find the maximum value of $f(x, y, z)=x y z$ subject to the constraint $x+y+z=48$.

$$
g(x, y, z)=x+y+z-48
$$

$$
\left.\left.\begin{array}{rl}
f_{x}(x, y, z)=\lambda g_{x}(x, y, z) & y z=\lambda \\
f_{y}(x, y, z)=\lambda g_{y}(x, y, z) & \begin{array}{l}
x z=\lambda \\
f_{z}(x, y, z)
\end{array}=\lambda g_{z}(x, y, z) \\
g(x, y, z) & =0
\end{array}\right\} \begin{array}{l}
x y=\lambda=x
\end{array}\right\} \frac{z}{y}=1
$$

## extremum problems with Constraints

Example Find the maximum value of $f(x, y, z)=x y z$ subject to the constraint $x+y+z=48$.

$$
g(x, y, z)=x+y+z-48
$$

$$
\left.\begin{array}{rl}
f_{x}(x, y, z)=\lambda g_{x}(x, y, z) & y z=\lambda \\
f_{y}(x, y, z)=\lambda g_{y}(x, y, z) & \begin{array}{l}
x z=\lambda \\
f_{z}(x, y, z)
\end{array} \lambda^{2} g_{z}(x, y, z) \\
g(x, y, z)=0 & x y=\lambda
\end{array}\right\} \begin{aligned}
& y=x \\
& y=z \\
&
\end{aligned}
$$

## extremum problems with Constraints

Example Find the maximum value of $f(x, y, z)=x y z$ subject to the constraint $x+y+z=48$.

$$
g(x, y, z)=x+y+z-48
$$

$$
\left.\begin{array}{lll}
f_{x}(x, y, z)=\lambda g_{x}(x, y, z) & y z=\lambda & y=x \\
f_{y}(x, y, z)=\lambda g_{y}(x, y, z) & \begin{array}{l}
x z=\lambda
\end{array} & y=z
\end{array}\right\} x=y=z \quad \begin{aligned}
& \\
& f_{z}(x, y, z)=\lambda g_{z}(x, y, z) \\
& g(x, y, z)=0
\end{aligned} \begin{array}{ll}
x y=\lambda & x+y+z-48=0 \longleftarrow \\
& 3 x-48=0 \quad x=16 \quad y=16 \quad z=16 \\
& f(16,16,16)=16^{3}=4096
\end{array}
$$
