## Course: Calculus (3)

Chapter: [14]<br>MULTIPLE INTEGRALS

Section: [14.1]
DOUBLE INTEGRALS

## THE AREA PROBLEM

Given a function $f$ that is continuous and nonnegative on an interval $[a, b]$, find the area between the graph of $f$ and the
 interval $[a, b]$ on the $x$-axis.

$$
\begin{aligned}
A & \approx \sum_{k=1}^{n} f\left(x_{k}^{*}\right) \Delta x_{k} \\
A & =\lim _{n \rightarrow \infty} \sum_{k=1}^{n} f\left(x_{k}^{*}\right) \Delta x_{k} \\
\int_{a}^{b} f(x) d x & =\lim _{n \rightarrow \infty} \sum_{k=1}^{n} f\left(x_{k}^{*}\right) \Delta x_{k}
\end{aligned}
$$

## THE VOLUME PROBLEM

Given a function $f$ of two variables that is continuous and nonnegative on a region $R$ in the $x y$-plane, find the volume of the solid enclosed between the surface $z=f(x, y)$ and the region $R$.

- Using lines parallel to the coordinate axes, divide the rectangle enclosing the region $R$ into subrectangles, and exclude from consideration all those sub-rectangles that contain any points outside of $R$.

## THE VOLUME PROBLEM

$$
\begin{aligned}
& V \approx \sum_{k=1}^{n} f\left(x_{k}^{*}, y_{k}^{*}\right) \Delta A_{k} \\
& V=\lim _{n \rightarrow \infty} \sum_{k=1}^{n} f\left(x_{k}^{*}, y_{k}^{*}\right) \Delta A_{k} \\
& \iint_{R} f(x, y) d A=\lim _{n \rightarrow \infty} \sum_{k=1}^{n} f\left(x_{k}^{*}, y_{k}^{*}\right) \Delta A_{k}
\end{aligned}
$$

which is called the double integral of $f(x, y)$ over $R$.

## EVALUATING DOUBLE INTEGRALS

- The partial derivatives of a function $f(x, y)$ are calculated by holding one of the variables fixed and differentiating with respect to the other variable.
- Let us consider the reverse of this process, partial integration.

$\checkmark$ The partial definite integral with respect to $x$.
$\checkmark$ Is evaluated by holding $y$ fixed and integrating with respect to $x$.

$\checkmark$ The partial definite integral with respect to $y$.
$\checkmark$ Is evaluated by holding $x$ fixed and integrating with respect to $y$.

## EVALUATING DOUBLE INTEGRALS

Example
(1) $\left.\int_{0}^{1} x y^{2} d x=y^{2} \int_{0}^{1} x d x=\frac{y^{2} x^{2}}{2}\right]_{0}^{1}=\frac{y^{2}}{2}$
(2) $\left.\int_{0}^{1} x y^{2} d y=x \int_{0}^{1} y^{2} d y=\frac{x y^{3}}{3}\right]_{0}^{1}=\frac{x}{3}$

NOTE - A partial definite integral with respect to $x$ is a function of $y$ and hence can be integrated with respect to $y$.

- A partial definite integral with respect to $y$ can be integrated with respect to $x$.
- This two-stage integration process is called iterated (or repeated) integration.

## EVALUATING DOUBLE INTEGRALS

- We introduce the following notation:

$$
\begin{aligned}
& \int_{c}^{d} \int_{a}^{b} f(x, y) d x d y=\int_{c}^{d}\left[\int_{a}^{b} f(x, y) d x\right] d y \\
& \int_{a}^{b} \int_{c}^{d} f(x, y) d y d x=\int_{a}^{b}\left[\int_{c}^{d} f(x, y) d y\right] d x
\end{aligned}
$$

- These integrals are called iterated integrals.

## EVALUATING DOUBLE INTEGRALS

Example Evaluate $\int_{1}^{3} \int_{2}^{4}(40-2 x y) d y d x$

$$
\left.\begin{array}{rl}
\int_{1}^{3} \int_{2}^{4}(40-2 x y) d y d x & =\int_{1}^{3}\left[\int_{2}^{4}(40-2 x y) d y\right] d x \\
& \left.=\int_{1}^{3}\left(40 y-x y^{2}\right)\right]_{2}^{4} d x \\
& =\int_{1}^{3}[(160-16 x)-(80-4 x)] d x
\end{array}\right)=\int_{1}^{3}(80-12 x) d x
$$

## EVALUATING DOUBLE INTEGRALS

Homework Evaluate $\int_{2}^{4} \int_{1}^{3}(40-2 x y) d x d y$
Fubini's Theorem
Let R be the rectangle defined by

$$
\begin{aligned}
R & =\{(x, y): a \leq x \leq b, c \leq y \leq d\} \\
& =[a, b] \times[c, d]
\end{aligned}
$$

If $f(x, y)$ is continuous on this rectangle, then

$$
\iint_{R} f(x, y) d A=\int_{a}^{b} \int_{c}^{d} f(x, y) d y d x=\int_{c}^{d} \int_{a}^{b} f(x, y) d x d y
$$

## EVALUATING DOUBLE INTEGRALS

Example Use a double integral to find the volume of the solid that is bounded above by the plane $z=4-x-y$ and below by the rectangle $R=[0,1] \times[0,2]$.

$$
\begin{aligned}
V=\iint_{R}(4-x-y) d A & =\int_{0}^{1} \int_{0}^{2}(4-x-y) d y d x=\int_{0}^{1}\left[\int_{0}^{2}(4-x-y) d y\right] d x \\
& \left.=\int_{0}^{1}\left(4 y-x y-\frac{y^{2}}{2}\right)\right]_{0}^{2} d x \\
& =\int_{0}^{1}(6-2 x) d x=5=\int_{0}^{2} \int_{0}^{1}(4-x-y) d x d y
\end{aligned}
$$

## PROPERTIES OF DOUBLE INTEGRALS

$$
\iint_{R} c f(x, y) d A=c \iint_{R} f(x, y) d A \quad \quad(c \text { constant })
$$

$$
\iint_{R}[f(x, y) \pm g(x, y)] d A=\iint_{R} f(x, y) d A \pm \iint_{R} g(x, y) d A
$$

$$
\iint_{R} f(x, y) d A=\iint_{R_{1}} f(x, y) d A+\iint_{R_{2}} f(x, y) d A
$$

## PROPERTIES OF DOUBLE INTEGRALS

NOTE If $R=[a, b] \times[c, d]$ is a rectangular region, and $f(x, y)=g(x) h(y)$, then

$$
\iint_{R} f(x, y) d A=\iint_{R} g(x) h(y) d A=\left[\int_{a}^{b} g(x) d x\right]\left[\int_{c}^{d} h(y) d y\right]
$$

Example $\int_{0}^{1} \int_{0}^{2} e^{x+y} d x d y=\int_{0}^{1} \int_{0}^{2} e^{x} e^{y} d x d y$

$$
=\left(\int_{0}^{2} e^{x} d x\right)\left(\int_{0}^{1} e^{y} d y\right)=\left(e^{2}-1\right)(e-1)
$$

## EXERCISE SET 14.1 QUESTION 33

Homework Evaluate the integral by choosing a convenient order of integration:

$$
\frac{1}{3 \pi}=\iint_{R} x \cos (x y) \cos ^{2}(\pi x) d A \quad ; \quad R=\left[0, \frac{1}{2}\right] \times[0, \pi]
$$

## Course: Calculus (3)

Chapter: [14]<br>MULTIPLE INTEGRALS

Section: [14.2]
DOUBLE INTEGRALS OVER NONRECTANGULAR REGIONS

## ITERATED INTEGRALS WITH NONCONSTANT LIMITS OF INTEGRATION

In this section we will see that double integrals over nonrectangular regions can often be evaluated as iterated integrals

$$
\text { Example } \begin{aligned}
\int_{0}^{1} \int_{-x}^{x^{2}} y^{2} x d y d x & \left.=\int_{0}^{1}\left[\int_{-x}^{x^{2}} y^{2} x d y\right] d x=\int_{0}^{1} \frac{x y^{3}}{3}\right]_{-x}^{x^{2}} d x \\
& \left.=\int_{0}^{1}\left(\frac{x^{7}}{3}+\frac{x^{4}}{3}\right) d x=\left(\frac{x^{8}}{24}+\frac{x^{5}}{15}\right)\right]_{0}^{1}=\frac{13}{120}
\end{aligned}
$$

## ITERATED INTEGRALS WITH NONCONSTANT LIMITS OF INTEGRATION

Example $\int_{0}^{\pi / 3} \int_{0}^{\cos y} x \sin y d x d y=\int_{0}^{\pi / 3}\left[\int_{0}^{\cos y} x \sin y d x\right] d y$
By Substitution

| Let $t=\cos y$ |
| :--- |
| $\frac{d t}{d y}=-\sin y$ |
| $d y=-\frac{d t}{\sin y}$ |
| $y=\pi / 3 \quad t=1 / 2$ |
| $y=0$ |$\quad t=1$$\quad$| $\left.=\int_{0}^{\pi / 3} \frac{x^{2} \sin y}{2}\right]_{0}^{\cos y} d y$ |
| :--- |
| $=\int_{0}^{\pi / 3} \frac{1}{2} \cos ^{2} y \sin y d y=-\frac{1}{2} \int_{1}^{1 / 2} t^{2} \sin y \frac{d t}{\sin y}$ |$\quad$| $\left.=\frac{1}{2} \int_{1 / 2}^{1} t^{2} d t=\frac{t^{3}}{6}\right]_{1 / 2}^{1}=\frac{7}{48}$ |
| :--- |

## DOUBLE INTEGRALS OVER NONRECTANGULAR REGIONS

## Type I Region

is bounded on the left and right by vertical lines $x=a$ and $x=b$ and is bounded below and above by continuous curves $y=g_{1}(x)$ and $y=g_{2}(x)$, where $g_{1}(x) \leq g_{2}(x)$ for $a \leq x \leq b$.

## Type II Region

is bounded below and above by horizontal lines $y=c$ and $y=d$ and is bounded on the left and right by continuous curves $x=h_{1}(y)$ and $x=h_{2}(y)$ satisfying $h_{1}(y) \leq h_{2}(y)$ for $c \leq y \leq d$

## DOUBLE INTEGRALS OVER NONRECTANGULAR REGIONS

1) If $R$ is a type I region on which $f(x, y)$ is continuous, then

$$
\iint_{R} f(x, y) d A=\int_{a}^{b} \int_{g_{1}(x)}^{g_{2}(x)} f(x, y) d y d x
$$

2) If $R$ is a type II region on which $f(x, y)$ is continuous, then

$$
\iint_{R} f(x, y) d A=\int_{c}^{d} \int_{h_{1}(y)}^{h_{2}(y)} f(x, y) d x d y
$$

## DOUBLE INTEGRALS OVER NONRECTANGULAR REGIONS

Example Evaluate $\iint_{R} x y d A$ over the region $R$ enclosed between $y=\frac{1}{2} x, y=\sqrt{x}$,

$$
x=2 \text { and } x=4
$$

## Type I Region

$$
\begin{aligned}
\iint_{R} x y d A & =\iint x y d y d x=\int_{2}^{4}\left[\int_{x / 2}^{\sqrt{x}} x y d y\right] d x \\
& \left.=\int_{2}^{4} \frac{x y^{2}}{2}\right]_{x / 2}^{\sqrt{x}} d x=\int_{2}^{4}\left(\frac{x^{2}}{2}-\frac{x^{3}}{8}\right) d x=\frac{11}{6}
\end{aligned}
$$

## DOUBLE INTEGRALS OVER NONRECTANGULAR REGIONS

Example Evaluate $\iint_{R}\left(2 x-y^{2}\right) d A$ over the triangular region $R$ enclosed between the lines $y=-x+1, y=x+1$, and $y=3$.

$$
\begin{aligned}
\iint_{R}\left(2 x-y^{2}\right) d A & =\iint\left(2 x-y^{2}\right) d x d y \\
& \left.=\int_{1}^{3} x^{2}-x y^{2}\right]_{1-y}^{y-1} d y \\
& =\int_{1}^{3}\left(2 y^{2}-2 y^{3}\right) d y=-\frac{68}{3}
\end{aligned}
$$

## Type II Region

## DOUBLE INTEGRALS OVER NONRECTANGULAR REGIONS

Example Evaluate $\iint_{R}\left(2 x-y^{2}\right) d A$ over the triangular region $R$ enclosed between the lines $y=-x+1, y=x+1$, and $y=3$.

$$
\iint_{R}\left(2 x-y^{2}\right) d A
$$

## Type I Region

## DOUBLE INTEGRALS OVER NONRECTANGULAR REGIONS

Example Evaluate $\iint_{R}\left(2 x-y^{2}\right) d A$ over the triangular region $R$ enclosed between the lines $y=-x+1, y=x+1$, and $y=3$.

$$
\iint_{R}\left(2 x-y^{2}\right) d A=\iint_{R_{1}}\left(2 x-y^{2}\right) d A+\iint_{R_{2}}\left(2 x-y^{2}\right) d A
$$

## Type I Region

$$
=\int_{-2}^{0} \int_{-x+1}^{3}\left(2 x-y^{2}\right) d y d x+\int_{0}^{2} \int_{x+1}^{3}\left(2 x-y^{2}\right) d y d x \quad y=-x+1
$$

## DOUBLE INTEGRALS OVER NONRECTANGULAR REGIONS

Example Evaluate $\int_{0}^{2} \int_{y / 2}^{1} e^{x^{2}} d x d y$
Since there is no elementary antiderivative of $e^{x^{2}}$, the integral cannot be evaluated by performing the $x$-integration first.

We will try to evaluate this integral by expressing it as an equivalent iterated integral with the order of integration reversed.

## DOUBLE INTEGRALS OVER NONRECTANGULAR REGIONS

$$
\begin{aligned}
& \text { Example Evaluate } \int_{0}^{2} \int_{y / 2}^{1} e^{x^{2}} d x d y \\
& \int_{0}^{2} \int_{y / 2}^{1} e^{x^{2}} d x d y=\iint e^{x^{2}} d y d x=\int_{0}^{1}\left[\int_{0}^{2 x} e^{x^{2}} d y\right] d x \\
& \begin{array}{ll} 
& \left.=\int_{0}^{1} e^{x^{2}} y\right]_{0}^{2 x} d x \\
\begin{array}{l}
\text { By Substitution } \\
\text { Let } t=x^{2}
\end{array} & =\int_{0}^{1} 2 x e^{x^{2}} d x=\int_{0}^{1} e^{t} d t=e-1
\end{array}
\end{aligned}
$$

## AREA CALCULATED AS A DOUBLE INTEGRAL

## Example

Use a double integral to find the area of the region $R$ enclosed between the parabola $y=\frac{1}{2} x^{2}$ and the line $y=2 x$.

$$
\text { area of } R=\iint_{R} 1 d A=\iint_{R} d A
$$

## AREA CALCULATED AS A DOUBLE INTEGRAL

$$
\text { area of } R=\iint_{R} 1 d A=\iint_{R} d A
$$

Example Use a double integral to find the area of the region $R$ enclosed between the parabola $y=\frac{1}{2} x^{2}$ and the line $y=2 x$.

$$
\text { Area of } \begin{aligned}
R & =\iint_{R} d A \quad \text { (Type II Region) } \\
& \left.=\int_{0}^{8} \int_{y / 2}^{\sqrt{2 y}} d x d y=\int_{0}^{8} x\right]_{y / 2}^{\sqrt{2 y}} d y \\
& =\int_{0}^{8}\left(\sqrt{2 y}-\frac{y}{2}\right) d y=\frac{16}{3}
\end{aligned}
$$

## AREA CALCULATED AS A DOUBLE INTEGRAL

$$
\text { area of } R=\iint_{R} 1 d A=\iint_{R} d A
$$

Example Use a double integral to find the area of the region $R$ enclosed between the parabola $y=\frac{1}{2} x^{2}$ and the line $y=2 x$.

$$
\text { Area of } \begin{aligned}
R & =\iint_{R} d A \quad \text { (Type I Region) } \\
& \left.=\int_{0}^{4} \int_{x^{2} / 2}^{2 x} d y d x=\int_{0}^{4} y\right]_{x^{2} / 2}^{2 x} d x \\
& =\int_{0}^{4}\left(2 x-\frac{x^{2}}{2}\right) d x=\frac{16}{3}
\end{aligned}
$$

## EXERCISE SET 14.2

9. Let $R$ be the region shown in the accompanying figure. Fill in the missing limits of integration.
(a) $\iint_{R} f(x, y) d A=\int_{\square}^{\square} \int_{\square}^{\square} f(x, y) d y d x$
(b) $\iint_{R} f(x, y) d A=\int_{\square}^{\square} \int_{\square}^{\square} f(x, y) d x d y$

## Course: Calculus (3)

Chapter: [14]<br>MULTIPLE INTEGRALS

Section: [14.3]
DOUBLE INTEGRALS IN POLAR COORDINATES

## SIMPLE POLAR REGIONS

- Some double integrals are easier to evaluate if the region of integration is expressed in polar coordinates.
- This is usually true if the region is bounded by any curve whose equation is simpler in polar coordinates than in rectangular coordinates.
- Example: Consider the quarter-disk $x^{2}+y^{2}=4$ in the first quadrant shown below.

```
Rectangular
Coordinates
\(0 \leq x \leq 2\)
\(0 \leq y \leq \sqrt{4-x^{2}}\)
```

$$
\begin{aligned}
& \begin{array}{c}
\text { Polar } \\
\text { Coordinates }
\end{array} \\
& 0 \leq r \leq 2 \\
& 0 \leq \theta \leq \pi / 2
\end{aligned}
$$

## DOUBLE INTEGRALS IN POLAR COORDINATES

NOTE A polar rectangle is a simple polar region for which the bounding polar curves are circular arcs.

Theorem If $R$ is a simple polar region whose boundaries are the rays $\theta=\alpha$ and $\theta=\beta$ and the curves $r=r_{1}(\theta)$ and $r=r_{2}(\theta)$, and if $f(r, \theta)$ is continuous on $R$, then

$$
\iint_{R} f(r, \theta) d A=\int_{\alpha}^{\beta} \int_{r_{1}(\theta)}^{r_{2}(\theta)} f(r, \theta) r d r d \theta
$$

## DOUBLE INTEGRALS IN POLAR COORDINATES

Example Find the volume of the solid bounded by the cylinder $x^{2}+y^{2}=4$ and the plane $y+z=4$.

$$
\begin{aligned}
V & =\iint_{R}(4-y) d A=\iint(4-r \sin \theta) r d r d \theta \\
& =\int_{0}^{2 \pi}\left[\int_{0}^{2}\left(4 r-r^{2} \sin \theta\right) d r\right] d \theta \\
& \left.=\int_{0}^{2 \pi}\left(2 r^{2}-\frac{1}{3} r^{3} \sin \theta\right)\right]_{0}^{2} d \theta=\int_{0}^{2 \pi}\left(8-\frac{8}{3} \sin \theta\right) d \theta \\
& \left.=\left(8 \theta+\frac{8}{3} \cos \theta\right)\right]_{0}^{2 \pi}=16 \pi
\end{aligned}
$$

## DOUBLE INTEGRALS IN POLAR COORDINATES

Example Evaluate $\int_{-1}^{1} \int_{0}^{\sqrt{1-x^{2}}}\left(x^{2}+y^{2}\right)^{3 / 2} d y d x$

$$
\begin{aligned}
\int_{-1}^{1} \int_{0}^{\sqrt{1-x^{2}}}\left(x^{2}+y^{2}\right)^{3 / 2} d y d x & =\iint\left(r^{2}\right)^{3 / 2} r d r d \theta \\
& =\int_{0}^{\pi} \int_{0}^{1} r^{4} d r d \theta=\int_{0}^{\pi} \frac{1}{5} d \theta=\frac{\pi}{5}
\end{aligned}
$$

## DOUBLE INTEGRALS IN POLAR COORDINATES

Example Evaluate $\iint_{R} \frac{1}{1+x^{2}+y^{2}} d A$ where $R$ is the region in the first quadrant bounded by $y=0, y=x, x^{2}+y^{2}=1$ and $x^{2}+y^{2}=4$.

$$
\begin{aligned}
\iint_{R} \frac{1}{1+x^{2}+y^{2}} d A & =\iint \frac{1}{1+r^{2}} r d r d \theta \\
& =\int_{0}^{\pi / 4}\left[\int_{1}^{2} \frac{r}{1+r^{2}} d r\right] d \theta
\end{aligned}
$$

$$
\tan \theta=\frac{y}{x}=\frac{x}{x}=1
$$

$$
\theta=\frac{\pi}{4}
$$

## DOUBLE INTEGRALS IN POLAR COORDINATES

Example Evaluate $\iint_{R} \frac{1}{1+x^{2}+y^{2}} d A$ where $R$ is the region in the first quadrant bounded by $y=0, y=x, x^{2}+y^{2}=1$ and $x^{2}+y^{2}=4$.

$$
\begin{aligned}
\iint_{R} \frac{1}{1+x^{2}+y^{2}} d A & =\iint \frac{1}{1+r^{2}} r d r d \theta \\
& \left.=\int_{0}^{\pi / 4}\left[\frac{1}{2} \int_{1}^{2} \frac{2 r}{1+r^{2}} d r\right] d \theta=\int_{0}^{\pi / 4} \frac{1}{2} \ln \left|1+r^{2}\right|\right]_{1}^{2} d \theta \\
& =\int_{0}^{\pi / 4} \frac{1}{2} \ln \left(\frac{5}{2}\right) d \theta=\frac{\pi}{8} \ln \left(\frac{5}{2}\right)
\end{aligned}
$$

$$
\begin{aligned}
\tan \theta & =\frac{y}{x}=\frac{x}{x}=1 \\
\theta & =\frac{\pi}{4}
\end{aligned}
$$

## DOUBLE INTEGRALS IN POLAR COORDINATES

Example Use a double-integral to show that the area of the region $R$ shown is $\frac{9 \pi}{2}$.
Area of $R=\iint_{R} d A=\iint r d r d \theta$

## DOUBLE INTEGRALS IN POLAR COORDINATES

Example Use a double-integral to show that the area of the region $R$ shown is $\frac{9 \pi}{2}$.

$$
\text { Area of } \begin{aligned}
R & =\iint_{R} d A=\iint_{0}^{3} r d r d \theta \\
& \left.=\int_{-\pi / 3}^{2 \pi / 3}\left[\int_{0}^{3} r d r\right] d \theta=\int_{-\pi / 3}^{2 \pi / 3} \frac{r^{2}}{2}\right]_{0}^{3} d \theta \\
& \left.=\int_{-\pi / 3}^{2 \pi / 3} \frac{9}{2} d \theta=\frac{9}{2} \theta\right]_{-\pi / 3}^{2 \pi / 3}=\frac{9 \pi}{2}
\end{aligned}
$$

## DOUBLE INTEGRALS IN POLAR COORDINATES

$$
\begin{aligned}
& \text { Example Evaluate } \int_{0}^{\infty} e^{-x^{2}} d x=I \\
& \begin{aligned}
I^{2}=\left(\int_{0}^{\infty} e^{-x^{2}} d x\right)^{2} & =\left(\int_{0}^{\infty} e^{-x^{2}} d x\right)\left(\int_{0}^{\infty} e^{-x^{2}} d x\right) \\
& =\left(\int_{0}^{\infty} e^{-x^{2}} d x\right)\left(\int_{0}^{\infty} e^{-y^{2}} d y\right) \\
& =\int_{0}^{\infty} \int_{0}^{\infty} e^{-x^{2}} e^{-y^{2}} d x d y=\int_{0}^{\infty} \int_{0}^{\infty} e^{-\left(x^{2}+y^{2}\right)} d x d y
\end{aligned}
\end{aligned}
$$

## DOUBLE INTEGRALS IN POLAR COORDINATES

$$
\begin{aligned}
& \text { Example Evaluate } \int_{0}^{\infty} e^{-x^{2}} d x=I \\
& I^{2}=\int_{0}^{\infty} \int_{0}^{\infty} e^{-\left(x^{2}+y^{2}\right)} d x d y=\int\left(e^{-r^{2}} r d r d \theta\right. \\
& \quad=\int_{0}^{\pi / 2}\left[\int_{0}^{\infty} r e^{-r^{2}} d r\right] d \theta \text { By substitution. Let } t=r^{2} \\
& \left.\quad=\int_{0}^{\pi / 2}\left[\int_{0}^{\infty} \frac{1}{2} e^{-t} d t\right] d \theta=\int_{0}^{\pi / 2} \frac{-1}{2} e^{-t}\right]_{0}^{\infty} d \theta=\int_{0}^{\pi / 2} \frac{1}{2} d \theta=\frac{\pi}{4}
\end{aligned}
$$

## Course: Calculus (3)

Chapter: [14]<br>MULTIPLE INTEGRALS

Section: [14.5]
Triple Integral [lterated Method]

## EVALUATING TRIPLE INTEGRALS OVER RECTANGULAR BOXES

Let $G$ be the rectangular box defined by the inequalities

$$
a \leq x \leq b \quad, \quad c \leq y \leq d \quad, \quad k \leq z \leq \ell
$$

If $f$ is continuous on the region $G$, then

$$
\iiint_{G} f(x, y, z) d V=\int_{a}^{b} \int_{c}^{d} \int_{k}^{\ell} f(x, y, z) d z d y d x
$$

Moreover, the iterated integral on the right can be replaced with any of the five other iterated integrals that result by altering the order of integration.

## evaluating Triple INTEGRALS OVER RECTANGULAR BOXES

Example Evaluate the triple integral $\iiint_{G} 12 x y^{2} z^{3} d V$ over the rectangular box

$$
\begin{aligned}
& G=[-1,2] \times[0,3] \times[0,2] \\
& \begin{aligned}
\iiint_{G} 12 x y^{2} z^{3} d V & =\int_{-1}^{2} \int_{0}^{3} \int_{0}^{2} 12 x y^{2} z^{3} d z d y d x=\int_{-1}^{2} \int_{0}^{3}\left[\int_{0}^{2} 12 x y^{2} z^{3} d z\right] d y d x \\
& =\int_{-1}^{3} \int_{0}^{3} 48 x y^{2} d y d x=\int_{-1}^{2} 432 x d x=648
\end{aligned} \\
& \iiint_{G} 12 x y^{2} z^{3} d V=12\left[\int_{-1}^{2} x d x\right]\left[\int_{0}^{3} y^{2} d y\right]\left[\int_{0}^{2} z^{3} d z\right]=648
\end{aligned}
$$

## EVALUATING TRIPLE INTEGRALS OVER MORE GENERAL REGIONS

$$
\begin{aligned}
& \text { Example Evaluate } \begin{aligned}
& \int_{0}^{1} \int_{0}^{y} \int_{0}^{1} \int_{0}^{\sqrt{1-y^{2}}} z d z d x d y \\
&\left.=\int_{0}^{y \sqrt{1-y^{2}}} \frac{1}{2}\left(1-y^{2}\right) x\right]_{0}^{y} d y=\int_{0}^{1} \frac{1}{2}\left(1-y^{2}\right) y d y \\
&=\frac{1}{2} \int_{0}^{1}\left(y-y^{3}\right) d y=\frac{1}{8}
\end{aligned}
\end{aligned}
$$
