Program Benchmarks for Department of Mechanical Engineering

1.Introduction

The Mechanical Engineering Profession is a discipline which has made a major positive impact on society by providing mechanical facilities and devices in many fields such as transportations, machines, automations, human welfare facilities like air conditioning and heating, water managements, and fire fighting systems, yet it is seldom defined in a manner which covers all its contributing activities.

Mechanical Engineering is a profession directed towards the application of the Mechanical Engineering body of knowledge (Solids, Fluids, and thermal design) which is based on mathematics, science and technology and integrated with business and management, which is acquired through education and professional formation in mechanical engineering discipline. Mechanical Engineering is directed towards developing, providing and maintaining solutions for, industry and the community. The outcome of Mechanical Engineering is a product that cambe distinguished from Science and Mathematics, and, its outcome can be described as follows.

The primary purposes of the Benchmarking Statements are to assist:

Higher education institutions in designing and validating programs of study.

Academic reviewers and external examiners in verifying and comparing standards.

Where appropriate, professional bodies during accreditation and review process.

Students and employers when seeking information about higher education provision.

<u>Table 1: Criteria of content of Mechanical Engineering Program:</u>

Mechanical Engineering practice				
knowledge and understanding of	 manufacturing and/or operational practice codes of practice and the regulatory framework requirements for safe operation 			
Intellectual abilities	 ability to produce solutions to problems through the application of Mechanical Engineering knowledge and understanding ability to undertake technical risk evaluation 			
Practical skills	ability to apply Mechanical engineering techniques taking account of industrial and commercial constraints			

	 project management
General transferable skills	 the Mechanical engineering approach to the solution of problems time and resource management teamwork and leadership

2.Assessment

In developing an assessment strategy some key factors should be considered:

There must be sufficient and clearly identified opportunities for students to demonstrate that they have met the threshold in all components of the benchmark.

Achievement of threshold standards may, in some cases, be implicit in the learning process (E.g. the completion of a project may demonstrate attainment of some general transferable skills);

Achievement of threshold standards should be possible without an individual student being required to pass all units of assessment. For example, a particular unit may include the assessment of only one element of the benchmark. A student may achieve the threshold in this element but not achieve a pass mark in the unit as a whole.

Careful selection from a wide range of assessment methods can make the process more efficient and effective;

It is important that the strategy provides sufficient opportunity for the best students to exhibit the level of innovation and creativity associated with excellence.

3. Recommendations

The Benchmark Statements set out in Table 2 and based upon the rationale provided by the criteria for content above should be used to guide the academic review of programs in mechanical engineering.

Individual disciplines within mechanical engineering should use the generic criteria of content in Table 1 to provide an interpretation of content and balance of attainment for their own discipline.

Professional Mechanical Engineering Institutions when setting criteria for their discipline and for the sections of the Mechanical Engineering Council Register, for which they hold responsibility, should relate them to the generic criteria and the appropriate discipline-specific interpretation.

Table 2: Benchmark Statements:

Mechanical Engineering practice	Threshold	Good	Excellent
 Knowledge and understanding of: Manufacturing and/or operational practice Codes of practice and the regulatory framework Requirements for safe operation 	has a basic knowledge of current practice has knowledge of specific codes of practice in routine problems, including the role of design factors has a basic knowledge of codes of practice relating to hazards and operational safety understands the need for operational safety by design and good working practices	some understanding of specific codes of practice, with some understanding of the limitations of the techniques and design factors involved has knowledge and understanding of codes of practice	understanding of current practice, its limitations, and likely new

to proble application engineering understanders and Ability to	o produce solutions ems through the on of mechanical ing knowledge and nding o undertake I risk evaluation	can integrate knowledge of mathematics, science, information technology, design, business context and mechanical engineering practice, to solve routine problems as taught can evaluate typical technical risks, using the appropriate tools as taught	information technology, design, business context and mechanical engineering practice to solve problems, some of which are unfamiliar and require good understanding can evaluate technical risks	can integrate knowledge of mathematics, science, information technology, design, business context and mechanical engineering practice, to solve a wide range of mechanical engineering problems applying profound understanding to novel and challenging situations, is aware of limitations of solution methods can make general evaluations of technical risks, through an understanding of the basis of such risks
engineer taking ac and com	o apply mechanical ing techniques ecount of industrial mercial constraints nanagement	has some experience of applying mechanical engineering techniques taking account of commercial and industrial constraints can develop a project plan, identifying the resource requirements, and the timescales involved	engineering techniques taking account of a range of commercial and	has experience of applying mechanical engineering techniques taking account of a wide range of commercial and industrial constraints can develop, monitor and update a plan, to reflect a changing operating environment

 General transferable skills The mechanical engineering approach to the solution of problems Time and resource management Teamwork and leadership 	can solve some general problems through systematic analysis and design methods can develop a personal plan of work to meet a deadline and to identify the main external constraints can work as part of a team	methods and where necessary learn new theories, concepts, methods etc in an unfamiliar situation outside the discipline area can identify the critical activities within a personal	can solve some general problems through systematic analysis design and planning, and where necessary, learn new theories, concepts, methods etc in an unfamiliar situation outside the discipline area can monitor and adjust a personal program of work on an on-going basis can undertake most of the roles within a team including leadership
