

# Aldehydes and Ketones

## Part 1

**B. Pharm. Semester-1**

**Course Code: 0510210; Session: 2022-2023**

**Dr. BALAKUMAR CHANDRASEKARAN**

**Professor-Faculty of Pharmacy  
Philadelphia University-Jordan**

# Learning Outcomes

---

**At the end of this lesson, students will be able to describe**

- **Carbonyl Compounds**
- **Aldehydes and Ketones**
- **Naming of Aldehydes and Ketones**
- **Preparation of Aldehydes**
- **Preparation of Ketones**

# Objective

---

The objective of this course is to give to the students of pharmacy the basic knowledge about the organic chemistry.

# Carbonyl compounds

- ❖ Carbonyl compounds are everywhere.
- ❖ Most biological molecules, pharmaceutical agents, and chemicals contain carbonyl groups.
- ❖ Citric acid, found in lemons and oranges; Acetaminophen;
- ❖ Dacron, the polyester material used in clothing
- ❖ All contain different kinds of carbonyl groups, All contain an acyl group ( $R-C=O$ ) bonded to another substituent.

Citric acid  
(a carboxylic acid)

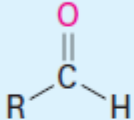

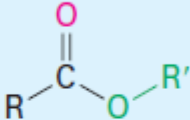

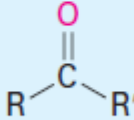

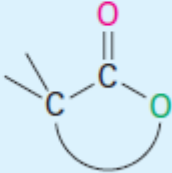

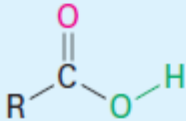

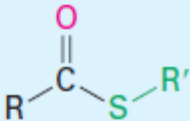

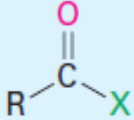

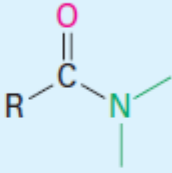

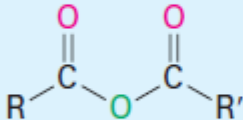

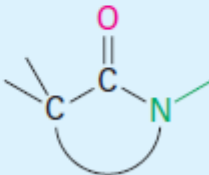

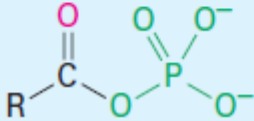

Acetaminophen  
(an amide)

Dacron  
(a polyester)

# Kinds of Carbonyl compounds

Name	General formula	Name ending	Name	General formula	Name ending
Aldehyde		<i>-al</i>	Ester		<i>-oate</i>
Ketone		<i>-one</i>	Lactone (cyclic ester)		None
Carboxylic acid		<i>-oic acid</i>	Thioester		<i>-thioate</i>
Acid halide		<i>-yl or -oyl halide</i>	Amide		<i>-amide</i>
Acid anhydride		<i>-oic anhydride</i>	Lactam (cyclic amide)		None
Acyl phosphate		<i>-yl phosphate</i>			

# Kinds of Carbonyl compounds

Aldehyde

Ketone

The  $-\text{R}'$  and  $-\text{H}$  in these compounds *can't* act as leaving groups in nucleophilic substitution reactions.

Carboxylic acid

Acid halide

Ester

Thioester

The  $-\text{OH}$ ,  $-\text{X}$ ,  $-\text{OR}'$ ,  $-\text{SR}$ ,  $-\text{NH}_2$ ,  $-\text{OCOR}'$ , and  $-\text{OPO}_3^{2-}$  in these compounds *can* act as leaving groups in nucleophilic substitution reactions.

Amide

Acid anhydride

Acyl phosphate

# Aldehydes and Ketones

- ✓ Aldehydes ( $\text{RCHO}$ ) and ketones ( $\text{R}_2\text{CO}$ ) are among the most widely occurring of all compounds and are characterized by the carbonyl functional group ( $\text{C}=\text{O}$ ).
- ✓ These compounds occur widely in nature as intermediates in metabolism and biosynthesis.
- ✓ They are also present in chemicals, as solvents, monomers, adhesives, agrichemicals and pharmaceuticals.

	<i>length</i>	<i>energy</i>
ketone $\text{C}=\text{O}$ bond	1.23 Å	178 kcal/mol (745 kJ/mol)
alkene $\text{C}=\text{C}$ bond	1.34 Å	146 kcal/mol (611 kJ/mol)

# Naming of Aldehydes

- ✓ Aldehydes are named by replacing the terminal -e of the corresponding alkane name with -al.
- ✓ The parent chain must contain the -CHO group.
- ✓ The -CHO carbon is numbered as C1.

**Ethanal**  
(Acetaldehyde)

**Propanal**  
(Propionaldehyde)

**2-Ethyl-4-methylpentanal**

# Naming of Aldehydes

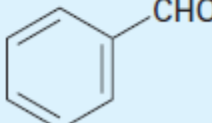

For cyclic aldehydes in which the -CHO group is directly attached to a ring, the suffix -carbaldehyde is used.

Cyclohexanecarbaldehyde

2-Naphthalenecarbaldehyde

Formula	Common name	Systematic name
HCHO	Formaldehyde	Methanal
CH <sub>3</sub> CHO	Acetaldehyde	Ethanal
H <sub>2</sub> C=CHCHO	Acrolein	Propenal
CH <sub>3</sub> CH=CHCHO	Crotonaldehyde	2-Butenal
	Benzaldehyde	Benzenecarbaldehyde

# Naming of Ketones

- ❖ Ketones are named by replacing the terminal -e of the corresponding alkane name with -one.
- ❖ The parent chain is the longest one that contains the ketone group, and the numbering begins at the end nearer the carbonyl carbon.

**3-Hexanone**

© 2004 Thomson/Brooks/Cole

**4-Hexen-2-one**

**2,4-Hexanedione**

**Acetone**

© 2004 Thomson/Brooks/Cole

**Acetophenone**

**Benzophenone**

# Aldehydes and Ketones as Substituents

- ❖ The  $\text{R}-\text{C}=\text{O}$  as a substituent is an acyl group is used with the suffix -yl from the root of the carboxylic acid
- ❖  $\text{CH}_3\text{CO}$ : acetyl;  $\text{CHO}$ : formyl;  $\text{C}_6\text{H}_5\text{CO}$ : benzoyl
- ❖ The prefix oxo- is used if other functional groups are present and the doubly bonded oxygen is labeled as a substituent on a parent chain.

# Preparation of Aldehydes

---

1. Oxidation of primary alcohols
2. Oxidation of methylbenzenes
3. Reduction of acid chlorides
4. Reimer-Tiemann reaction: Phenolic aldehydes

# 1. Oxidation of Primary Alcohols

## 2. Oxidation of Methyl benzenes

*Examples:*

### 3. Reduction of acid chlorides

*Examples:*

## 4. Reimer-Tiemann reaction: Phenolic aldehydes

Treatment of a phenol with chloroform and aqueous hydroxide introduces an aldehyde group (R-CHO) into the aromatic ring, generally ortho to the OH group. This reaction is known as the Reimer-Tiemann reaction.

A substituted benzal chloride is initially formed, but is hydrolyzed by the alkaline reaction medium.

# Preparation of Ketones

---

- 1. Oxidation of secondary alcohols**
- 2. Friedel-Crafts acylation**
- 3. Reactions of acid chlorides with organocadmium compounds**
- 4. Acetoacetic ester synthesis**

# 1. Oxidation of Secondary Alcohols

*Example:*

## 2. Friedel-Crafts acylation

*Examples:*

### 3. Reaction of acid chlorides with organocadmium compounds

Examples:

## 4. Acetoacetic ester synthesis

One of the most valuable methods of preparing ketones makes use of **ethyl acetoacetate** (acetoacetic ester),  $\text{CH}_3\text{COCH}_2\text{COOC}_2\text{H}_5$  and is called the acetoacetic ester synthesis of ketones.
